*Marine Ecology Progress Series* 468:267–278 (2012)

**Supplement.** Sample details and basic genetic data for the fish analyzed.

Table S1. *Gadus morhua*. Details of the different samples. Pos/Loc: exact position or locality name. BT: bottom trawl, PT: pelagic trawl, SS: shore seine. AA, AB, and BB are numbers of the different *Pan I* genotypes. A freq: frequency of the *Pan I*<sup>A</sup> allele.  $H_o$  and  $H_e$ : observed and expected frequency of heterozygotes.  $F_{IS}$  significant at \* $p < 0.05$ , \*\* $p < 0.01$ , or \*\*\* $p < 0.001$ . S&F: corresponding sample number in Sarvas & Fevolden (2005), na: not applicable, <sup>ms</sup>: sample also analyzed for microsatellites. Dates presented as dd.mm.yyyy

Table S2. *Gadus morhua*. Basic genetic data for 16 microsatellite loci analyzed for 7 samples from Varangerfjord (V; 31 August and 1 September 1996), Laksefjord (L; 2 September 1996), and Porsangerfjord (P; 4 October 2000). SS: shore seine, PT: pelagic trawl, BT: bottom trawl. Sample size (n), number of alleles (A), observed ( $H_o$ ) and expected ( $H_e$ ) heterozygosity, and  $F_{IS}$  values are given for each individual locus and sample. Significance levels for deviations from expected Hardy-Weinberg proportions were adjusted according to the sequential Bonferroni procedure (Rice 1989). Significant  $F_{IS}$  estimates are asterisked (\*\*\*)  $p < 0.001$  level). na: estimates not available
