1. INTRODUCTION

The International Bottom Trawl Survey Working Group, formerly known as the International Young Fish Survey Working Group, has the responsibility of coordinating various research vessel surveys conducted within certain ICES areas. The first survey to be coordinated was the International Young Fish Survey (IYFS) that was conducted in the North Sea and Skagerrak/Kattegat in February of each year starting in the late 1960's. A procedural manual was produced for the use of scientists involved in this survey and subsequently two revised editions were produced as international co-operation developed. In 1991 this co-operative programme was expanded to include the three other quarters in the North Sea and Skagerrak/Kattegat. This necessitated major alterations to the manual and the revised edition was published as ICES C.M. 1992/H:3.

During the Annual Science Conference in St. John's, Newfoundland in 1994 the recommendation was made that the International Bottom Trawl Survey Working Group should also incorporate the coordination of bottom trawl surveys in ICES Sub-Areas VI, VII and VIII and Division IXa (within this document these areas are designated as the western and southern areas).

In 1995 the manual was revised for a fifth time in order to clarify certain aspects of the surveys in the North Sea and Skagerrak/Kattegat. At the same time the opportunity was taken to review the manual to establish whether the same procedures could be applied to Sub-Areas VI, VII and VIII and Division IXa. It was decided that some aspects of the manual applied equally to all areas but some procedures required dedicated text. At the same time it was decided that a manual for the western and southern areas required further discussion and input from countries closely associated with these areas but who were unable to attend the meeting. Consequently procedures unique to the western and southern areas are provided in Appendix XI as a draft; if approved by all participants these draft proposals may be incorporated into the manual at a later date.

The objective of the IBTS Working Group is to standardise fishing gear and methods for all surveys but it is appreciated that the change from national gears to the GOV (the preferred gear) cannot be achieved immediately so although other types of gear are not described in this manual provision is made in the Exchange Data Format for information obtained by non-standard gear to be exchanged internationally.

Provisional data obtained from the North Sea and Skagerrak/Kattegat should be submitted to the quarterly coordinator as soon as possible after completion of the cruise. Appendix X lists the length splits for the various target species. Final data should be submitted to the ICES Secretariat in the format as listed in section 6 of this manual. The files can be transmitted via a floppy disk or by e-mail.

2. THE GOV-TRAWL

2.1 Construction

The construction of the 36/47 GOV-trawl is shown in Figure 2.1.

Special attention is drawn to the lining of the cod-end. This lining should consist of 400 stretched meshes of 20 mm each, giving a total length of 8 m. The total circumference of the lining should be 600 meshes.

Details of the "Exocet" kite and suggestions how to attach the kite to the trawl are shown in Figure 2.2. Five floats with a buoyancy of 2.9 kg each should be attached to the kite. If another kite than the recommended one is used then the lift of this kite should be the same as of the Exocet kite so that the configuration of the net conforms to expected parameters. Figures 2.6 and 2.7 illustrate the expected warp out / headline height ratio and the warp out / door spread ratio.

Total buoyancy of the floats on the net should be 172 kg. The floats should be spread as evenly as possible over the wings and the square.

2.2 Rigging

The rigging is given in Figure 2.3.

During the first quarter survey the length of the sweeps should depend on the bottom depth:

- m sweeps (including backstrops) are used in water depths less than 70 m,
- m sweeps (including backstrops) are used in deeper waters.

In the other quarters a sweep length of 60 m (including backstrops) is used throughout the survey area.

The standard groundrope with 10-20 cm rubber discs as shown in Figure 2.4 should be used throughout the survey area. The extra weights in the groundrope are 70 kg in the square, 35 kg in each wing and 35 kg in each wing-end. These weights should be evenly spread over the appropriate length of groundrope and this can be achieved by wrapping chain externally around the groundrope or, preferably, by interspersing the groundrope rubber discs with steel discs of the same diameter.

It is very important to achieve good bottom contact over the whole groundrope and this should be checked regularly. A proper contact of the net could be indicated by acoustic devices, wearing on chains and presence of benthic organisms and flatfish in the catch. The contact of the net with the bottom can also be greatly influenced by changing the length of the adjustment chain between the lower leg and the bumper bobbin. The normal length of this chain is 2 metres but on rough ground it can be shortened to 1.7 metres; if the gear is fishing too light it can be lengthened to 2.2 metres.

For a proper performance of the net it is essential that the four upper bridles are of identical length, and regular checks should be made to ensure this. It is also recommended that a total check of the trawl is carried out prior to the survey.

2.3 Standard Fishing Method

Standard fishing speed is 4 knots measured as trawl speed over the ground. The recommended speed is set as a target and actual (ground)speed and distance towed should be monitored and reported. It is also recommended that the speed of the trawl through the water should be monitored and reported.

Each haul lasts 30 minutes. Start time is defined as the moment when the vertical net-opening and doorspread are stable at a trawl speed of 4 knots. Stop time is defined as the start of pull back.

Vertical net opening and doorspread should be monitored at 30 second intervals and mean values should be reported. It is recommended that also wing spread is measured.

The recommended warp/depth ratio for the GOV trawl is shown in Figure 2.5. A minimum warp length of 150 m should be used as below this length the gear becomes unstable and insufficient spread is achieved. Maximum fishing depth in the North Sea is 200 m and in Division IIIa 250 m.

It is preferable to only conduct trawling operations during daylight hours although it is recognised that some institutes may wish to trawl both during the day and night. It is however strongly recommended that during the February survey the trawling in the old herring standard area (see Figure 6.4) is carried out during daytime only. The daylight period is defined as the time between 15 minutes before sunrise until 15 minutes past sunset. Daylight hours for various periods and latitudes are given in the text table below:

Daylight period in UTC at 0 degrees longitude:

Dates		South of 57° 30' N			North of 57° 30' N		
01-10	Jan	08.09	-	15.58	08.45	-	15.25
10-20	Jan	08.01	-	16.17	08.31	-	15.45

Source: 'The Times Atlas' 1972, p 33.

For each degree longitude west, 4 minutes should be added and for each degree longitude east, 4 minutes should be subtracted.

2.4 Fishing Positions

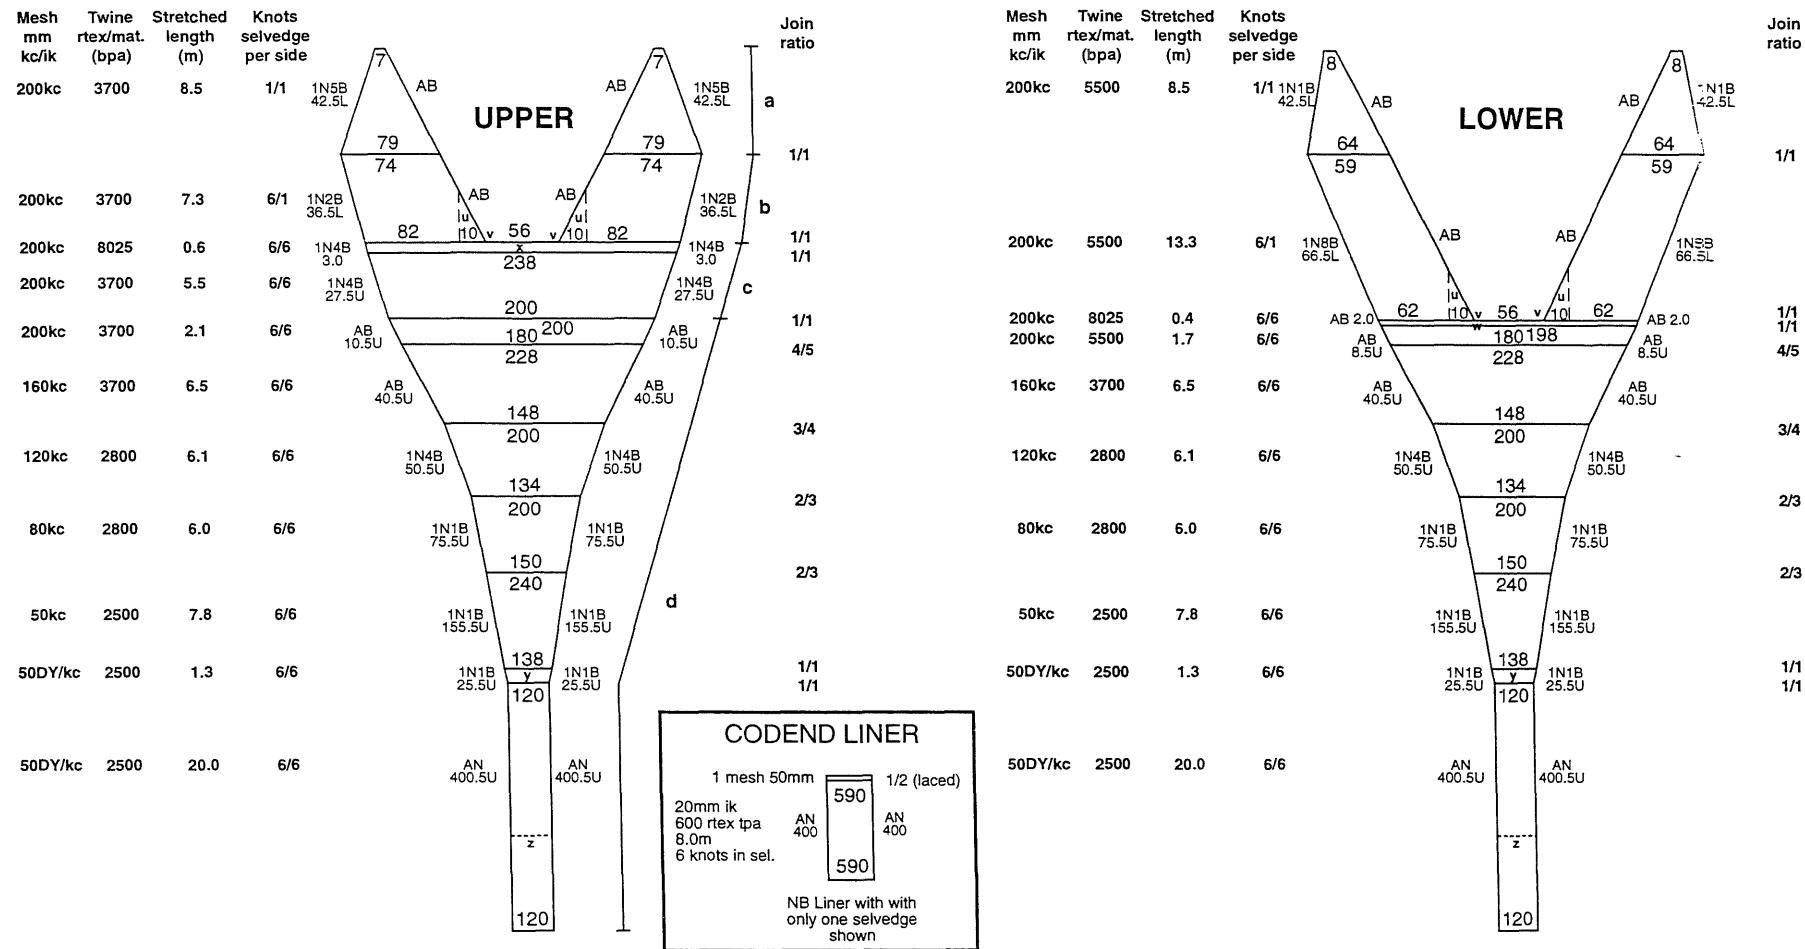

Most statistical rectangles contain a number of possible tows that are deemed to be free of obstruction and vessels are free to choose any of these positions in the rectangles that they are surveying. In some rectangles sampling may be further stratified due to significant changes in sea bed depth which may, in turn, cause variations in the fish population. In such cases it is extremely important that the same depths are sampled in each survey year.

In rectangles or strata that are to be sampled more than once by the same vessel it is recommended that valid hauls are separated by at least one day or by at least 10 miles wherever this is possible. Tows in adjacent rectangles should also be separated by at least 10 miles.

Fishing should not be influenced by fish shoals located by sonar or echo sounder.

The exchange of clear tow positions is to be encouraged and this may be in the form of data formatted for immediate entry into a ship's navigational system or, alternatively, as an ASCII file as specified in Appendix I.

Construction of the 36/47 GOV trawl (adapted from drawings of the Institute des Peches Maritimes, Boulogne/Mer)

Headline : 36m (15.50 + 5.00 + 15.50) x 14mm ϕ wire (f/c) served (6/19 - 12/6/1 65.8kg/100m).

Fishingline : 47.20m (21.10 + 5.00 + 21.10) x 22mm ϕ combination wire 6 strand/steel core 54.6kg/100m).

Winglines : Upper 8.2m, Lower 8.2m x 20mm ϕ combination wire (6 strand/steel core 54.4kg /100m)

a - 7.1m x 14mm ϕ wire (6/19 - 12/6/1 - 65.8kg/100m)

b - 6.7m x 20mm ϕ combination wire (6 strand/steel core - 54.4kg/100m)

c - 5.55m x 20mm ϕ combination wire (6 strand/steel core - 54.4kg/100m)

d - length for length x 22mm ϕ nylon (3 strand - 26kg/100m)

u - Gussets 8025rtex

v - 4 meshes gathered at quarters

w - 200 198

x - 240 238

y - 138 120

z - Joining position for Liner

kc = knot centre to knot centre

ik = inside knot measurement

tpa = polyamide twine/twisted

bpa = polyamide twine/braided

dy = double yarn

Method of join used, sewing.
Type of knot, weavers knot.

NOTE TO NETMAKERS

The numbers of meshes shown for netting panel widths do NOT include selvedge meshes. Five meshes (six knots) per selvedge must be added where indicated. Conversely to obtain panel depths one row (1/2 mesh) must be subtracted from each panel as the joining row is included in the number of meshes deep. The total numbers of meshes (width and depth) for each individual panel are set out in GOV 36/47 Groundfish Survey Trawl Checklist (Page 2 of 5)

3. SAMPLING OF GOV-TRAWL CATCHES

3.1 Length composition

Length distributions are recorded for all fish species caught. Length is defined as total length (measured from tip of snout to tip of caudal fin). Length is measured to 0.5 cm below for herring and sprat, and to 1 cm below for all other species.

In case the catch of a certain species is too large to measure all individuals, a sub-sample may be taken which should contain at least 50 specimens.

If a certain species (notably cod or haddock) is caught in two clearly distinct size groups, each of these size groups should be sampled separately by measuring at least 50 fish from each of them.

In case of large catches ($n > 1000$) of any species, the minimum sample size given above should be doubled.

Certain related species that are hard to distinguish from one another may be grouped by genus or larger taxonomic unit.

3.2 Sampling for Age, Sex and Maturity

Otolith samples are collected within 9 specified sampling areas as illustrated in Figure 6.2. For all species the same areas are used but care should be taken not to extract otoliths from fish that exhibit length deformities.

For the target species the following minimum sampling levels should be maintained for each sampling area:

herring	:	8 otoliths per 1/2 cm group
sprat	:	8 otoliths per 1/2 cm group
mackerel	:	8 otoliths per 1 cm group
cod	:	8 otoliths per 1 cm group
haddock	:	8 otoliths per 1 cm group
whiting	:	8 otoliths per 1 cm group
Norway pout	:	8 otoliths per 1 cm group
saithe	:	8 otoliths per 1 cm group

For the smallest size groups, that presumably contain only one age group, the number of otoliths per length class may be reduced. Conversely more otoliths per length are required for the larger length classes.

Participants are encouraged to collect age samples also from other commercially important species such as saithe, plaice and IIIa sole.

Sex and maturity data may be reported for each species for which age data are collected. Maturity stages should be reported according to the simplified maturity scale given in Appendix II.

4. METHOT ISAAC KIDD NET

4.1 Construction and Rigging

The Methot Isaac Kidd (MIK) net is a midwater ring trawl and is the standard gear for the sampling of fish larvae during the International Bottom Trawl Survey in the first quarter.

The parts of the gear, as shown in Figures 4.1 and 4.2 are:

- a) ring of 2 meter diameter
- b) black net of 1.6 mm pore, 13 meter long, strengthened by nylon straps. In the last meter of the net a 500 mm net is inserted (b1)
- c) bolts for mounting the net on the ring
- d) dihedral depressor which is 2 meter long and 0.5 meter wide
- e) pair of 10 meter long bridles to the gear
- f) pairs of 1.5 meter long bridles to the depressor
- g) pair of 1.5 meter long wires between gear and depressor-bridles
- h) bucket (\varnothing 11 cm) for collection of the plankton sample
- i) flow meter mounted on a string crossing the ring, positioned in the centre of the ring

4.2 Fishing Method

Because of the length of the bridles it is necessary to haul them through the block; thus a strong block is necessary, and the connection between bridle and hauling wire ought to be relatively small.

In order to monitor the distance of the gear to the bottom an echo sounder should be mounted, optionally a wireless echo sounder (e.g. SCANMAR) should be used. This should be placed in the lower part of the ring.

If no wireless sounder is available the transmitting cable could be relieved by use of a second, 9-10 meter long, pair of bridles as shown in Figure 4.3.

When the gear is put out the net should float freely, and the depressor should be under water before the ring is lowered under water.

4.3 Sampling Procedure

Hauls should only be made during the period between 30 minutes past sunset to 30 minutes before sunrise (see table in section 2.3 for the definition of sunrise and sunset). If there is no cloud cover, i.e. the daylight period has been extended, then fishing should not begin until 60 minutes after sunset and cease 60 minutes before sunrise.

Fishing speed is 3 knots.

The haul profile is oblique to 5 meter above the bottom (i.e measured from the lower part of the ring). Maximum depth of tow should, however, be 100 meter. If the haul duration of a single oblique haul is less than 10 minutes a double oblique haul must be made.

The wire is paid out at a speed of 25 meter per minute and retrieved at 15 m/min.

The flowmeter is read before and after each haul.

The duration and distance towed must be recorded.

The position of sampling is the shooting position.

On deck the hindmost part of the net (the 500 mm netting) is washed into the bucket.

4.4 Sample and Data Treatment

The samples should be preserved in 4% formalin in fresh water.

It is recommended that lengths of larvae are measured after preservation. If measurements are made before preservation this should be indicated on the standard form (Figure 4.4).

Herring and sprat larvae should be identified, and their standard length (see Figure 4.5) measured to the millimetre below.

Catches of eel should also be indicated on the standard form. Optionally other species may be reported.

Preferably samples are processed and reported within one month after termination of the survey.

The standard forms (Figure 4.4) should be mailed to Peter Munk, Danish Institute for Fisheries and Marine Research, Charlottenlund Castle, DK-2920 Charlottenlund, Denmark.

The data will be included in a data base on DIFMAR. A revised copy of data will be available at ICES Secretariat.

The standard areas for which the abundance of herring larvae is calculated is shown in Figure 6.5.

4.5 Calibration of the Flowmeter

The flowmeter used in the survey should be calibrated to revolutions per meter. One method is to tow the MIK (without the bucket) at a depth of about 10 meter for a known distance and make at least two measurements in opposite directions.

4.6 Allocation of Rectangles

At least 2 hauls are made within each standard rectangle and the distance between hauls in a rectangle is at least 10 nm.

Each year, the chairman of the IBTS WG announces the allocation of rectangles to all participants.

During the survey the status of MIK-sampling should be reported to the coordinating vessel. If there is any risk that rectangles will be left unsampled then initiatives should be taken to reallocate sampling between participants.

sample analysed by:

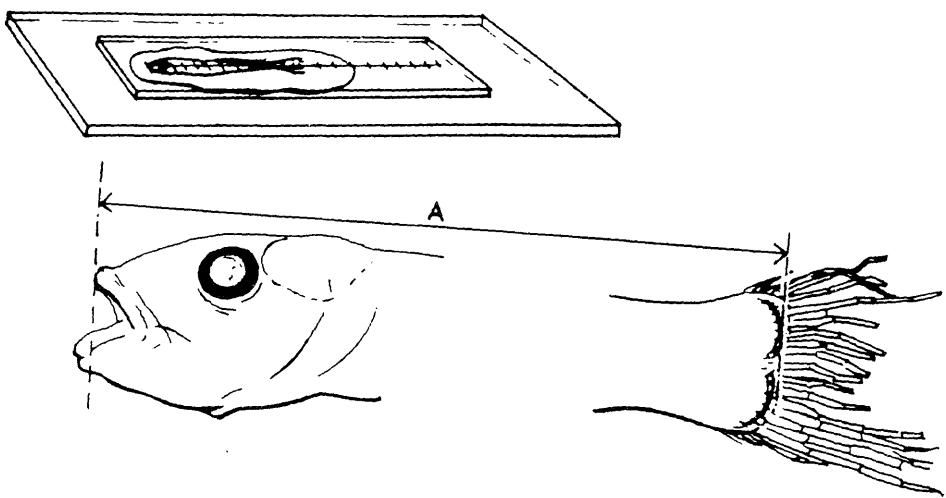

Figure 4.5 Measurement of standard length of herring and sprat larvae (to the millimetre below)

5. ENVIRONMENTAL DATA

After each haul with the GOV trawl, the following minimum hydrographical data are collected:

- surface temperature
- bottom temperature
- surface salinity
- bottom salinity

When using a CTD-probe for measuring temperature and salinity, the CTD should be calibrated against a sample collected by Nansen bottle at each station.

Participants are recommended to collect nutrient samples during the International Bottom Trawl Survey in the first quarter. For further specifications they should contact the ICES Hydrographer.

Since 1992 the following additional environmental data are sought:

- surface current direction
- surface current speed
- bottom current direction
- bottom current speed
- wind direction
- wind speed
- swell direction
- swell height

The above parameters should be reported in an additional file. The format of this file is specified in section 6.3.

6. EXCHANGE TAPE SPECIFICATIONS FOR IBTS DATA

Note: in force from 1 June 1992

6.1 General Information

When data are exchanged it is important to give details of the data, such as the number of records of each record type, and the number of CA-records per species.

6.1.1 Floppy disk requirements

- ASCII coding
- all standard disk formats are acceptable
- preferably 3.5 inch disks

6.1.2 Format of data

Four distinct types of computer records have been defined for standard storage of the IYFS data:

- Type 1 : Record with detailed haul information
Type 1A: Record with additional haul information
Type 2 : Length frequency data
Type 3 : Length age frequency data
Type 4 : Sex-maturity-age-length keys (SMALK's)

The detailed formats of these five record types are given on following pages.

NB:

- 1) Record Type 3 (Length frequency and age data) shall only be used for exchanging historic survey data.
- 2) Details of environmental data should be submitted to the Hydrographic Service of ICES according to established procedures. The national hydrographic station number must be reported in Record Type 1 to enable the link to be made between haul data and environmental data.

6.1.3 File structure

The records must be ordered in such a way that each record of Type 1 is followed by a variable number of records of Type 2 (or Type 3), ordered by species. The number and kinds of species recorded must agree with the species recording code as specified in record Type 1. For examples of the various codes see Appendix V.

Records of Type 4 should follow at the end of the file after the last species record of Type 2 for the last haul.
Records of Type 1A should be submitted in a separate file.

6.2 Record type 1

SPECIFICATIONS FOR RECORD TYPE 1 (Haul information)

POSITION	NAME	TYPE*	M/O**	RANGE	COMMENTS
1 - 2	Record type	2A	M		Fixed value HH.

92 - 95	Weight ground rope	4N	O	0 to 300	In kilogrammes.
96 - 98	Door spread	3N	O	50 to 180	In metres.
99 - 100	Paddingfield	2A	M	Spaces	Filled up with spaces.

* All numeric fields (N) right justified, zero filled, except when spaces are used to indicate no information.

All alpha (A) and mixed alpha/numeric fields (AN) left justified, space filled.

** M=mandatory, O=optional. For all optional fields spaces are valid and indicate not known.

COMMENTS:

- 1) ICES is maintaining this code list. Laboratories should ask the Secretariat for new codes, if the gear they report is not included in the list. Numerical information on gear aspects is defined in position 67-98 and is only required for the GOV trawl.
- 2) Code P is reserved for situations, when no liner has been used, ultimately this should be evident from the gear code. For the time being it seems appropriate to include it here.

NB: FOR INVALID HAULS NO SPECIES INFORMATION NEED TO BE GIVEN

6.3 Record Type 1A

SPECIFICATIONS FOR RECORD TYPE 1A (Haul information)

POSITION NAME	TYPE*	M/O**	RANGE	COMMENTS
1 - 2 Record type	2A	M		Fixed value HE.
3 Quarter	1N	M	1 to 4	
4 - 6 Country	3A	M	See Appendix III	ICES alpha code for Countries.
7 - 10 Ship	4AN	M	See Appendix III	
11 - 20 Gear	10A	M	See Appendix IV	Preliminary code. 1)
21 - 26 Station no	6AN	O		National coding system.
27 - 29 Haul no	3N	M	1 to 999	Sequential numbering by cruise.
30 - 31 Year	2N	M	65 to 99	
32 - 33 Lat. degrees	2N	M	50 to 64	Hauling position: Degr. Latitude.
34 - 35 Lat. minutes	2N	M	0 to 59	Hauling position: Min. Latitude.
36 - 37 Lon. degrees	2N	M	0 to 15	Hauling position: Degr. Longitude.
38 - 39 Lon. minutes	2N	M	0 to 59	Hauling position: Min. Longitude.
40 East/West	1A	M	E, W	Hauling position:
41 - 43 Towing direction	3N	O	1 to 360	
44 - 45 Ground speed	2N	O	20 to 60	Ground speed of trawl. Knots*10
46 - 47 Speed through water	2N	O	10 to 99	Trawl speed through. Knots*10
48 - 49 Wing spread	2N	O	12 to 30	In metres.
50 - 52 Surface current direction	3N	O		0 to 360 0 slack water
53 - 55 Surface current speed	3N	O	0 to 100	Metres per sec*10
56 - 58 Bottom current direction	3N	O		0 to 360 0 slack water
59 - 61 Bottom current speed	3N	O	0 to 100	Metres per sec*10
62 - 64 Wind direction	3N	O	0 to 360	
65 - 67 Wind speed	3N	O	0 to 100	Metres per sec
68 - 70 Swell direction	3N	O	0 to 360	
71 - 73 Swell height	3N	O	0 to 1000	Metres*10
74 - 100 Paddingfield	27A	M	Spaces	Filled up with spaces.

* All numeric fields (N) right justified, zero filled, except when spaces are used to indicate no information.
All alpha (A) and mixed alpha/numeric fields (AN) left justified, space filled.

** M=mandatory, O=optional.
For all optional fields spaces are valid and indicate not known.

COMMENTS:

- 1) ICES is maintaining this code list. Laboratories should ask the Secretariat for new codes, if the gear they report is not included in the list. Numerical information on gear aspects is only required for the GOV trawl.

6.4 Record Type 2

SPECIFICATIONS FOR RECORD TYPE 2 (Length frequency distribution)

POSITION NAME	TYPE*	M/O**	RANGE	COMMENTS
1 - 2 Record type	2A	M	Fixed value HL.	
3 Quarter	1N	M	1 to 4	Identical to Record Type 1.
4 - 6 Country	3A	M	See Appendix III	idem
7 - 10 Ship	4AN	M	See Appendix III	idem
11 - 20 Gear	10A	M	See Appendix IV	idem
21 - 26 Station no	6AN	O	idem	
27 - 29 Haul no	3N	M	1 to 999	idem
30 - 31 Year	2N	M	65 to 99	idem
32 - 41 Species code	10A	M	See Appendix VII	Official NODC-code.
42 - 43 Validity code	2N	M	See Appendix VIII	
44 - 50 No/hour	7N	M	0 to 9999999	No. of specimens caught per hour.
51 - 55 Catch Weight/Hour	5N	M	0 to 99999, spaces	In 100g. Not known= spaces. 1)
56 - 58 No measured	3N	M	0 to 999, spaces	Not known=spaces. 2)
59 Length code	1AN	M	,, 0, 1, 5, 9, space	Class: 1mm=, 0.5cm=0 1cm=1 5cm=5 +group=9 no information=space. 3)
60 - 62 Length class	3N	M	1 to 999, spaces	Identifier: lower bound of size class, eg. 65-70cm=65. For 0.5 cm classes there will be an implied decimal point after the 2nd digit, eg. 30.5-31.0cm=305.
63 - 68 No at length	6N	M	1 to 999999, spaces	Length classes with zero catch should be excluded from the record (N/hour equals the sum of No at length).
69 Sex	1A	O	M,F	M=male, F=female
70 - 100 Paddingfield	32A	M	Spaces	Filled up with spaces

* All numeric fields (N) right justified, zero filled, except when spaces are used to indicate no information.
All alpha (A) and mixed alpha/numeric fields (AN) left justified, space filled.

** M=mandatory, O=optional.

For all optional fields spaces are valid and indicate not known.

COMMENTS:

- 1) Total catch weights should be given per hour fishing.
- 2) If the number measured is zero then the remainder of the record should be filled with spaces.
- 3) Size classes smaller than those defined in the IYFS manual for reporting length distributions of the various species are allowed.

6.5 Record Type 3

SPECIFICATIONS FOR RECORD TYPE 3 (Length age frequency)

NB: This record has been designed for records of the earlier surveys, where in absence of ALK's subjective the length distributions have been split in age compositions on the basis of (subjective) inspection of the length distributions.

The record MUST NOT be used for present and future surveys!!

POSITION NAME	TYPE*	M/O**	RANGE	COMMENTS
1 - 2 Record type	2A M			Fixed value HA.
3 Quarter	1N M		1 to 4	Identical to Record Type 1.
4 - 6 Country	3A M		See Appendix III	idem
7 - 10 Ship	4AN M		See Appendix III	idem
11 - 20 Gear	10A M		See Appendix IV	idem
21 - 26 Station no	6AN O			idem
27 - 29 Haul no	3N M		1 to 999	idem
30 - 31 Year	2N M		65 to 99	idem
32 - 41 Species code	10A M		See Appendix VII	Official NODC-code.
42 - 43 Validity code	2N M		See Appendix VIII	
44 - 50 No/hour	7N M		0 to 9999999	No. of fish caught per hour of the species given.
51 - 55 Catch Weight/hour	5N M		0 to 99999, spaces	In 100g. Not known=spaces 1)
56 - 58 No measured	3N M		0 to 999, spaces	Not known=spaces 2)
59 Length code	1AN M		,, 0, 1, 5, 9	Class: 1mm=. 0.5cm=0 1cm=1 5cm=5 +group=9. 3)
60 - 62 Length class	3N M		1 to 999	Identifier: lower bound of size class, eg. 65-70cm=65. For 0.5 cm classes there will be an implied decimal point after the 2nd digit, eg. 30.5-31.0cm=305.
63 - 68 No at length	6N M		1 to 999999	Length classes with zero catch should be excluded from the record (N/hour equals the sum of No at length).
69 Plus group identifier	1A M		+, space	Plus group=+ else space, refers to age/rings.
70 - 71 Age/rings	2N M		0 to 99, spaces	Unknown age/rings=spaces.
72 - 100 Paddingfield	29A M		Spaces	Filled up with spaces.

* All numeric fields (N) right justified, zero filled, except when spaces are used to indicate no information.
All alpha (A) and mixed alpha/numeric fields (AN) left justified, space filled.

** M=mandatory, O=optional.

For all optional fields spaces are valid and indicate not known.

COMMENTS:

- 1) See note for Record Type 2.
- 2) See note for Record Type 2.
- 3) See note for Record Type 2.

6.6 Record Type 4

SPECIFICATION FOR RECORD TYPE 4 (SMALK's)

POSITION NAME	TYPE*	M/O**	RANGE	COMMENTS
1 - 2 Record type	2A	M		Fixed value CA.
3 Quarter	1N	M	1 to 4	Identical to Record Type 1.
4 - 6 Country	3A	M	See Appendix III, ALL	idem
7 - 10 Ship	4AN	O	See Appendix III	1)
11 - 20 Gear	10A	O	See Appendix IV	idem 1)
21 - 26 Station no	6AN	O		idem 1)
27 - 29 Haul no	3N	O	1 to 999	idem 1)
30 - 31 Year	2N	M	65 to 99	idem 1)
32 - 41 Species code	10A	M	See Appendix VII	Official NODC-code.
42 - 43 Area type	2N	M	0 to 3	ICES Statistical rectangles=0 Four Statistical rectangles=1 Standard NS Roundfish areas=2 Herring Sampling areas=3.
44 - 47 Area code	4AN	M	See Appendix IX	
48 - 51 Paddingfield	4A	M	Spaces	Filled up with spaces.
52 Length code	1AN	M	, 0, 1, 5	Identical to Record Type 2 (+group not allowed). 2)
53 - 55 Length class	3N	M	1 to 999	idem
56 Sex	1A	M	M, F, space	Male=M, Female=F, Unknown=space
57 Maturity	1AN	M	1 to 4, space	See Appendix II 3)
58 +gr. ident.	1A	M	+, space	Plus group=+ else space. 4)
59 - 60 Age/rings	2N	M	0 to 99, spaces	Unknown age/rings=spaces. 5)
61 - 63 Number	3N	M	1 to 999	6)
64 - 100 Paddingfield	37A	M	Spaces	Filled up with spaces.

* All numeric fields (N) right justified, zero filled, except when spaces are used to indicate no information.
 All alpha (A) and mixed alpha/numeric fields (AN) left justified, space filled, except Area code which is to be right justified, space filled.

** M=mandatory, O=optional.

For all optional fields spaces are valid and indicate not known.

COMMENTS:

- 1) Otolith samples may refer to an individual haul or to groups of hauls in the same rectangle or within one sampling area, depending on the procedures on board. If detailed information is available, it would seem appropriate to refer back to the haul no and/or rectangle; these data are optional rather than mandatory.
- 2) See Record Type 2.
- 3) Sex maturity data are explicitly demanded for roundfish.
- 4) A plus group refers to the age indicated AND older, respectively to a reading of more than or equal to the specified number of rings.
- 5) For herring and sprat the number of rings must be recorded. For all other species the age.
- 6) An additional field has been reserved for no of fish, which allows the information to be presented in a more aggregated form, rather than that identical information has to be recorded for all individual fish of the same size, sex, maturity and age group.

APPENDIX I

IBTS CLEAR TOW DATA

Required information:	Country Year Shoot position Haul position Accuracy Rectangle Gear
-----------------------	---

Country: code as per standard 3 letter code (ICES exchange format)

Year: full format e.g. 1992

Shoot position: degrees decimal minutes if possible please

Haul position: idem

Accuracy: accuracy to which position data was recorded as decimal places, e.g.:

50 35.25	=	accuracy code 2
50 35.3	=	accuracy code 1
50 35	=	accuracy code 0 (data this coarse is not really any use)

Rectangle: ICES rectangle

Gear: as per code below

Description	Options
Gear type (3 characters)	GOV
Sweep length (metres)	60/110
Groundrope type (standard or bobbins)	S/B

Acceptable file formats are:

Format	Extension
Excel	.XLS
Lotus 1-2-3	.WK?
Dbase3	.DBF
Comma separated	.CSV

The data should be exchanged on high or double density 3.5" disks.

APPENDIX II

MATURITY KEY

1. VIRGIN

- Male Testes very thin translucent ribbon lying along an unbranched blood vessel.
 No sign of development.
- Female Ovaries small, elongated, whitish, translucent. No sign of development.

2. MATURING

- Male Development has obviously started, colour is progressing towards creamy white and the testes are filling more and more of the body cavity but sperm cannot be extruded with only moderate pressure.
- Female Development has obviously started, eggs are becoming larger and the ovaries are filling more and more of the body cavity but eggs cannot be extruded with only moderate pressure.

3. SPAWNING

- Male Will extrude sperm under moderate pressure to advanced stage of extruding sperm freely with some sperm still in the gonad.
- Female Will extrude eggs under moderate pressure to advanced stage of extruding eggs freely with some eggs still in the gonad.

4. SPENT

- Male Testes shrunken with little sperm in the gonads but often some in the gonoducts which can be extruded under light pressure. Resting condition firm, not translucent, showing no development.
- Female Ovaries shrunken with few residual eggs and much slime. Resting condition, firm, not translucent, showing no development.

APPENDIX III
ALPHA CODES FOR COUNTRIES AND SHIPS

COUNTRY	ICES CODE	SHIP'S NAME	IYFS CODE

Sweden	SWE	Thesis Skagerak Argos	- THE - SKA - ARG
Union of Soviet Socialist Republics	USS	Viandra Vaida Aliot Antares Korifena	- VIA - VAI - ALI - ANT - KOR

APPENDIX IV

PRELIMINARY ALPHANUMERIC CODE FOR IYFS / IBTS GEARS

DHT	Dutch Herring Trawl	Scotia, Cirolana
DHT40	40 Feet	Clupea
DHT45	45 Feet	Willem Beukelsz
DHT48	48 Feet	Explorer
DHT63	63 Feet	Tridens
DHT73	73 Feet	Tridens
HT	Herring Bottom Trawl	Dana: 3 Winged trawl
HT120	120 Feet	Dana
HT180	180 Feet	Anton Dohrn
VIN	Vinge Trawl	Scotia
INT	Industrial Trawl	G.O.Sars, Feiebas
GRT	Granton Trawl	G.O.Sars, Feiebas, Cirolana
HOB	High Opening Bottom Trawl	Tridens, G.O.Sars
GOV	Grand Ouverture Verticale	Standard gear for all vessels
ABD	Aberdeen 48 ft Trawl	Scotia
COM	Commercial trawl with sprat bag	Irish commercial trawl
BOX	Boris 'Goshawk' Box Trawl	England
PHHT	Potuguese High Headline Trawl	Cirolana
GOVS	Small GOV 20/25	Gwen Drez
BAKA	Baka Trawl	Cornide de Saavedra
NCT	Norwegian Campelen Trawl	Noruega

Within the gear field the following positions have been reserved for recording various types of rigging:

Position 14-16 Sweep length in m. (Numeric, right justified, zero filled. Spaces for unknown.

Code 000 indicates the semi-pelagic rigging, this specification is associated with the GOV.)

Position 17: Exceptions (B=Bobbins used, D=Double sweeps, space=standard or not known).

Position 18: Door type (P=Polyvalent, V=Vee, F=Flat, K=Karm Waco, space=others or not known).

Further quantitative numeric information on rigging of gear is defined in positions 74-95, in Record Type 1.

NB: This code must still be considered as a preliminary one. More detailed information on the gears used in the past is required before a completely comprehensive coding system can be developed.

APPENDIX V

RECORDED SPECIES CODES

- NB: 1) Zero catches of a particular species in a haul may be included in or excluded from the file. However, any species deliberately excluded from a subset, or an invalid species for a particular haul, should be included for each haul with a species validity code 0 !!.
- 2) For species codes see Appendix VI and VII.

RECORDED STANDARD SPECIES LIST CODES (POSITION 65)

0	= No standard species recorded
1	= All (7) standard species recorded
2	= Pelagic (3) standard species recorded
3	= Roundfish (4) standard species recorded
4	= Individual (1) standard species recorded

1)
1)
2)

RECORDED BY-CATCH SPECIES LIST CODES (POSITION 66)

0	= No by-catch species recorded
1	= Open ended by-catch list - All species, even species complexes
2	= Closed by-catch list - All (27) species recorded
3	= Closed by-catch list - Gadoid (8) species recorded
4	= Closed by-catch list - Flatfish (9) species recorded
5	= Closed by-catch list - Various (10) species recorded

1)
1)
1)

- 1) For definition see Appendix VI.
2) If this code is applied, zero catches of the species recorded must be recorded in Record Type 2 format.

EXAMPLES OF APPLICATION OF THE SPECIES RECORDING CODE AND CORRESPONDING TREATMENT IN THE ANALYSIS PHASE

1) All species are recorded.

Species recording code = 1 1

Comments: All fish species incorporated in Appendix VII are reported. Records for species having zero catches may be omitted, but for species which have deliberately not been counted must be included with validity code 0.

Analysis: Zeroes are generated for a species for which no record exists. Hauls with species validity code 0 are omitted for that species.

2) All standard pelagic species are recorded and no others.

Species recording code = 2 0

Comments: The catch of other species than herring sprat and mackerel is not available.

Analysis: Zeroes are generated for a standard pelagic species for which no record exists. For other species a validity code 0 is generated and the haul will thus be omitted.

3) All standard roundfish species and herring are recorded.

Species recording code = 1 0

Comments: The catch of other species than cod, haddock, whiting, Norway pout and herring is not available. The non-available standard species in the reference list for code 1 (sprat and mackerel) must be included in the file showing validity code 0. Standard species having zero catches may be omitted from the file.

Analysis: Zeroes are generated for a standard species for which no record exists. For other species a validity code is generated and the haul will thus be omitted.

4) Only one species recorded (e.g. herring).

Two options exist to cope with this example:

Option A.

Species recording code = 2 0

Comments: Sprat and mackerel must be recorded with validity code 0. Zero catches of herring may be omitted.

Analysis: As in example 3.

Option B.

Species recording code = 4 0

Comments: For each haul a record must be given showing the herring catch, even when it is zero.

Analysis: Species validity code 0 is generated for all other species than the one reported (i.e. herring) and the haul will thus be omitted from the analysis.

APPENDIX VI

SPECIES NAMES AND NODC CODES FOR STANDARD AND CLOSED BY-CATCH LISTS

GROUP	SPECIES	NODC
Standard Pelagic	Herring	8747010201
	Sprat	8747011701
	Mackerel	8850030302
Standard Roundfish	Cod	8791030402
	Haddock	8791031301
	Whiting	8791031801
	Norway pout	8791031703
By-catch Gadoid	Saithe	8791030901
	Pollack	8791030902
	Pouting	8791031702
	Poor cod	8791031701
	Blue whiting	8791032201
	Hake	8791040105
	Ling	8791031901
	Tusk	8791031101
By-catch Flatfish	Plaice	8857041502
	Dab	8857040904
	Long rough dab	8857040603
	Lemon sole	8857041202
	Witch	8857040502
	Megrim	8857032302
	Turbot	8857030402
	Brill	8857030403
	Halibut	8857041902
	Flounder	8857041402
	Sole	8858010601
By-catch Various	Grey gurnard	8826020601
	Red gurnard	8826020801
	Spurdog	8710010201
	Horse mackerel	8835280103
	Red mullet	8835450202

APPENDIX VIII

SPECIES VALIDITY CODE

0 = INVALID INFORMATION	Information lost.
1 = VALID INFORMATION	No per hour and total length composition recorded; applies also when No per hour is zero.
2 = PARTLY VALID INFORMATION	Refers to haul validity code P; only valid for fish over 20 cm because no liner has been used; applies also when No per hour is zero.
3 = LENGTH COMPOSITION INCOMPLETE	Only part of the catch has been measured.
4 = TOTAL NO PER HOUR ONLY	Catch sampled for No per hour only; no length measurements.
9 = VALID INFORMATION AVAILABLE BUT NOT RECORDED ON THE FILE	Data not processed on the file.

APPENDIX IX

AREA CODES, SAMPLING AREAS AND STANDARD AREAS FOR THE CALCULATION OF ABUNDANCE INDICES

AREA CODES

0	=	ICES Statistical Rectangles	See Doc. C.M. 1977/Gen:3.
1	=	Four Statistical Rectangles	See Figure 6.1
2	=	Standard Roundfish Areas	See Figure 6.2
3	=	Herring Sampling Areas	See Figure 6.3

NB: There has been confusion in the definition of herring areas in the past and for some years no ALK's may have been collected for areas 14, 15 and 67, in which case these areas must be considered as subsets of 12, 13 and 63 respectively. The Skagerrak/ Kattegat areas have also not always been distinguished in which case the appropriate code should be 80.

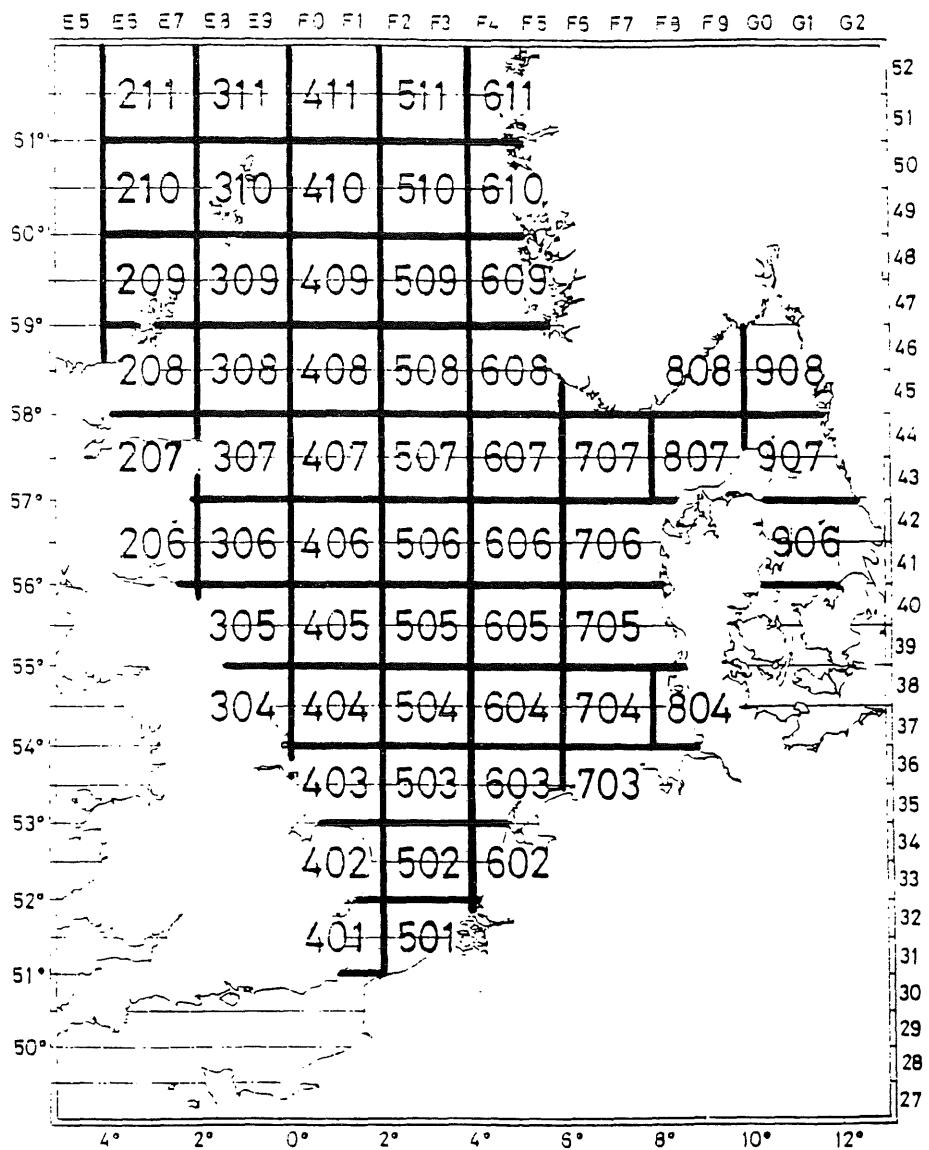

Figure 6.1 Four Statistical Rectangles: used for sampling roundfish otoliths up to and including 1979, for herring up to and including 1982.

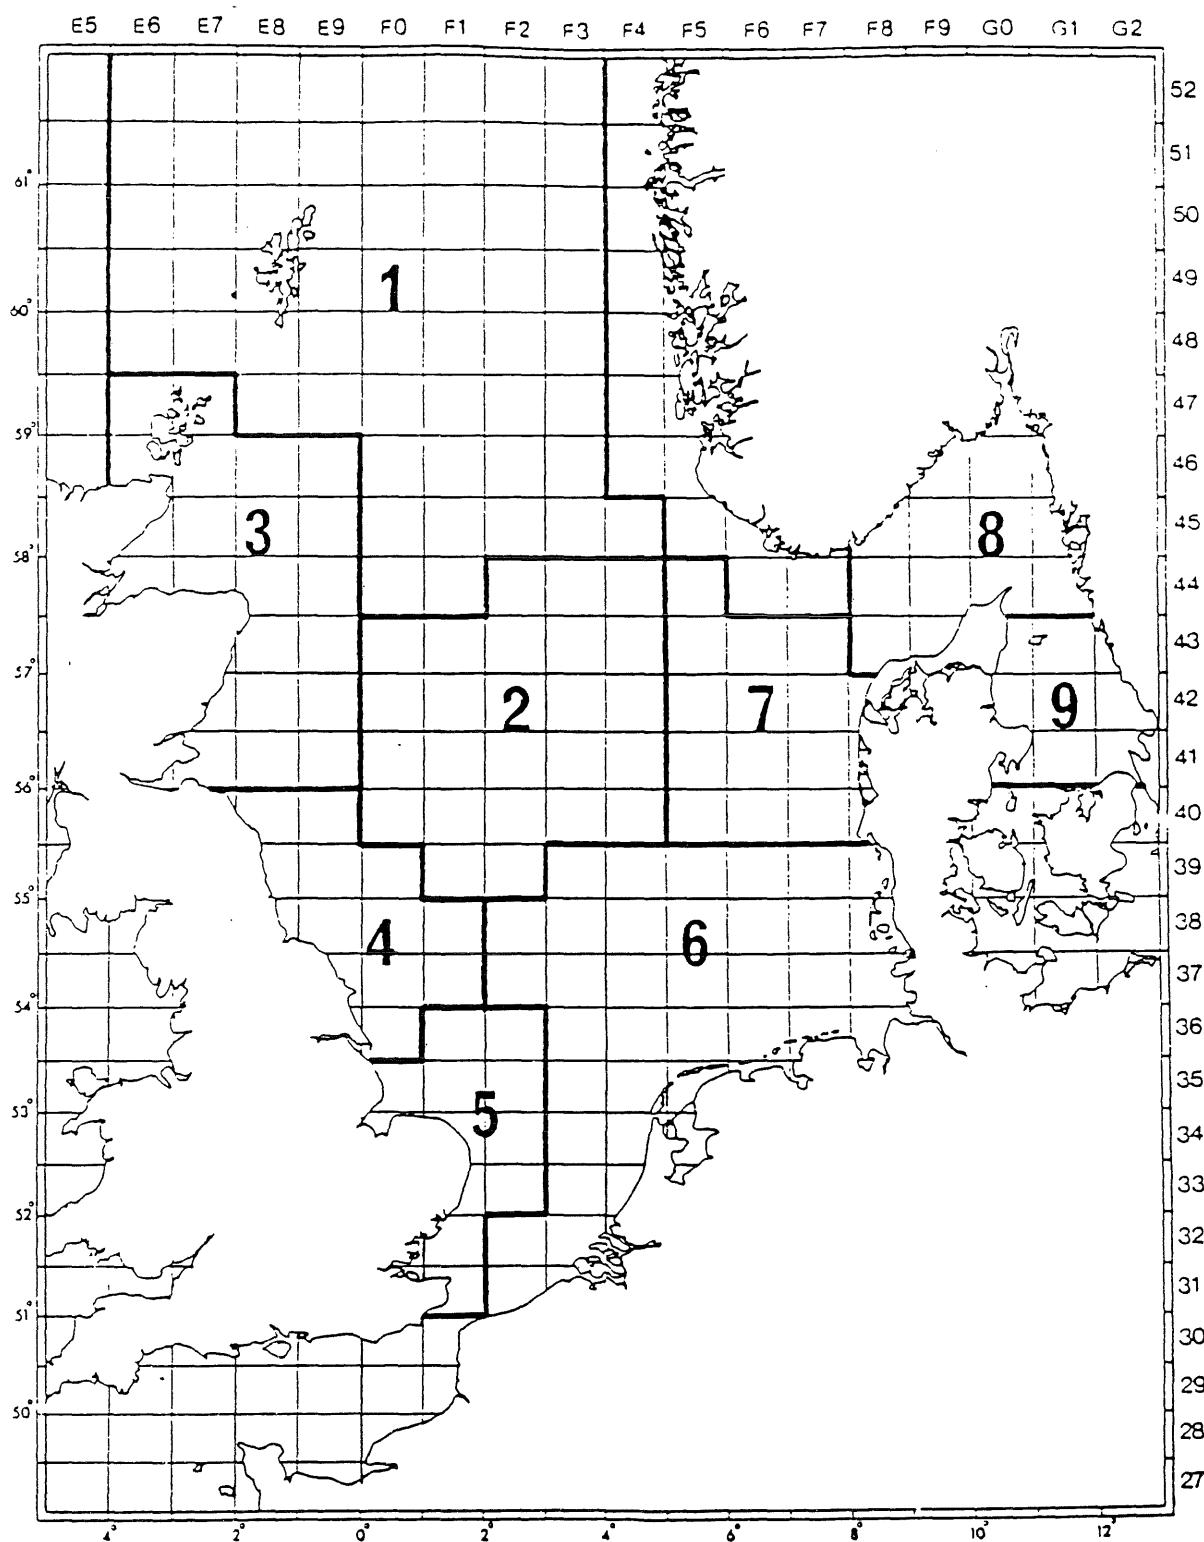

Figure 6.2 Standard Roundfish Areas: used for roundfish since 1980, for all standard species since 1991.

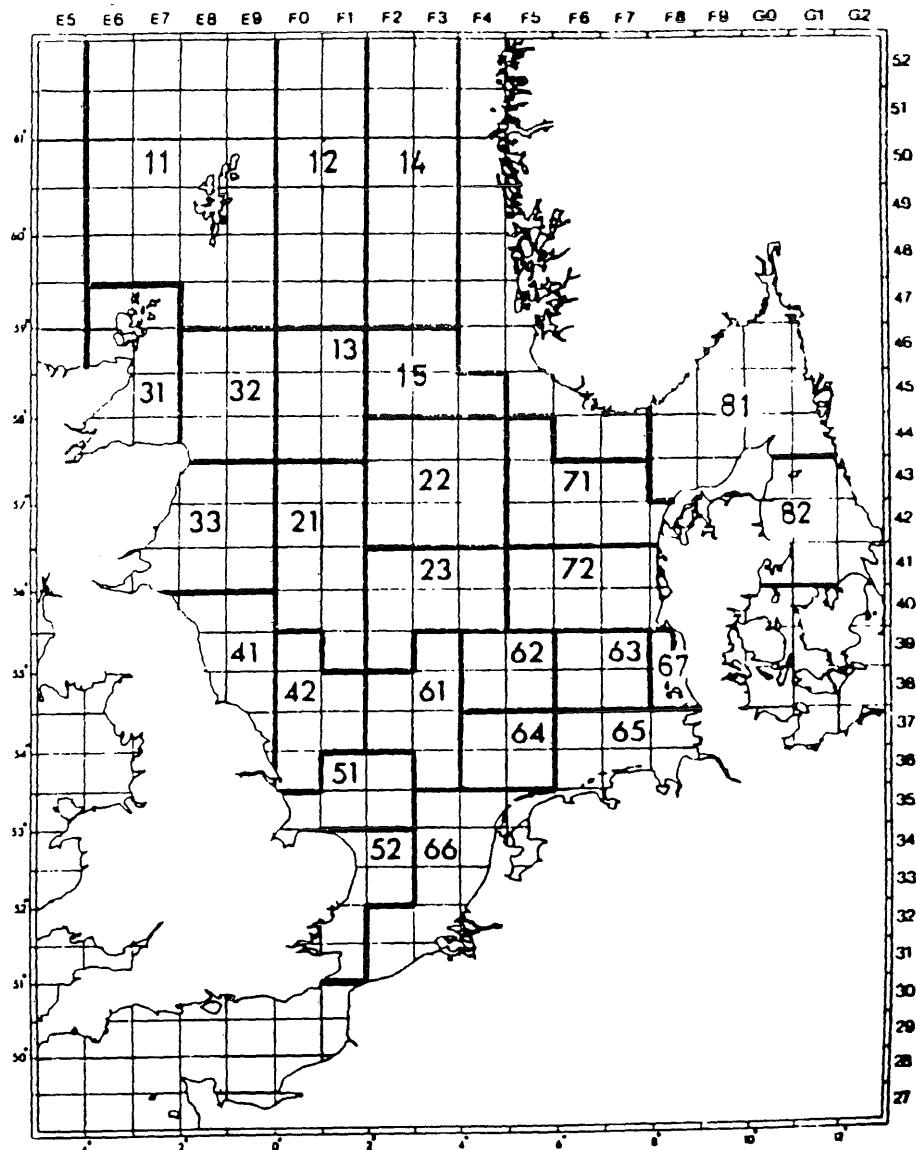

Figure 6.3 Herring Sampling Areas: used in the period 1983-1990.

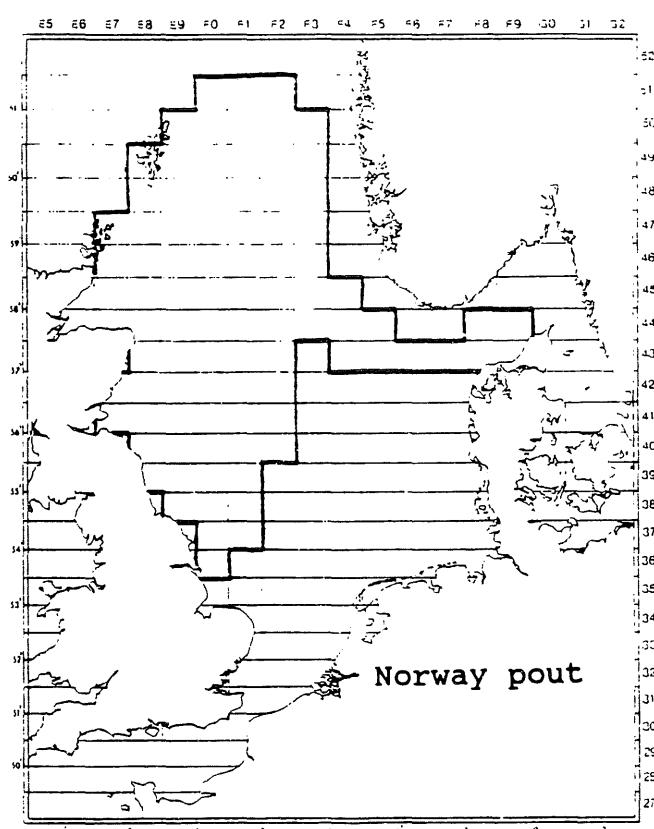

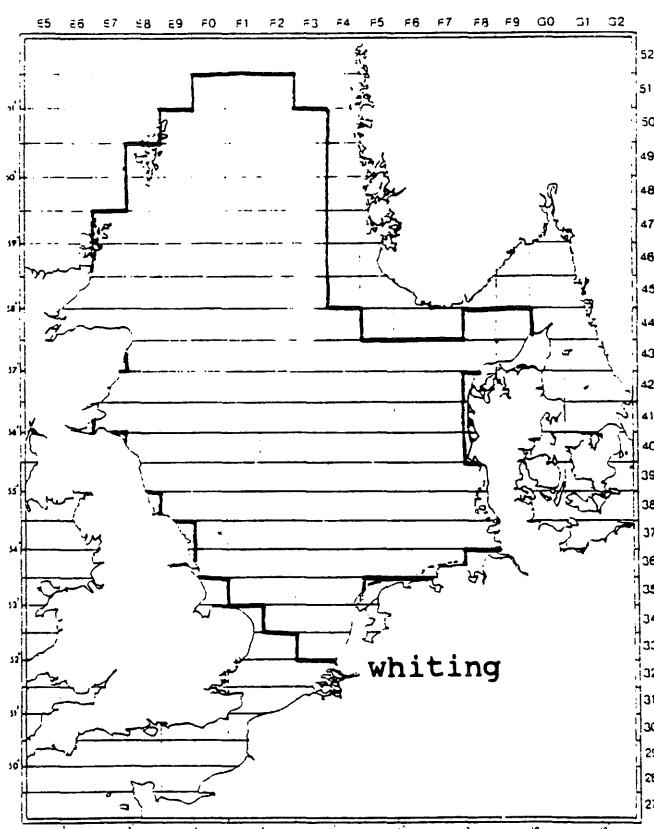

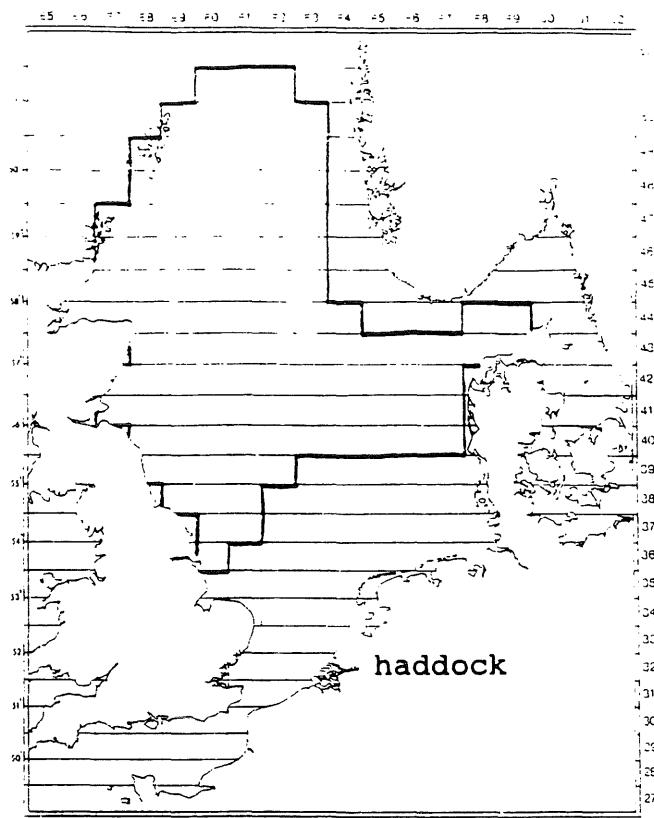

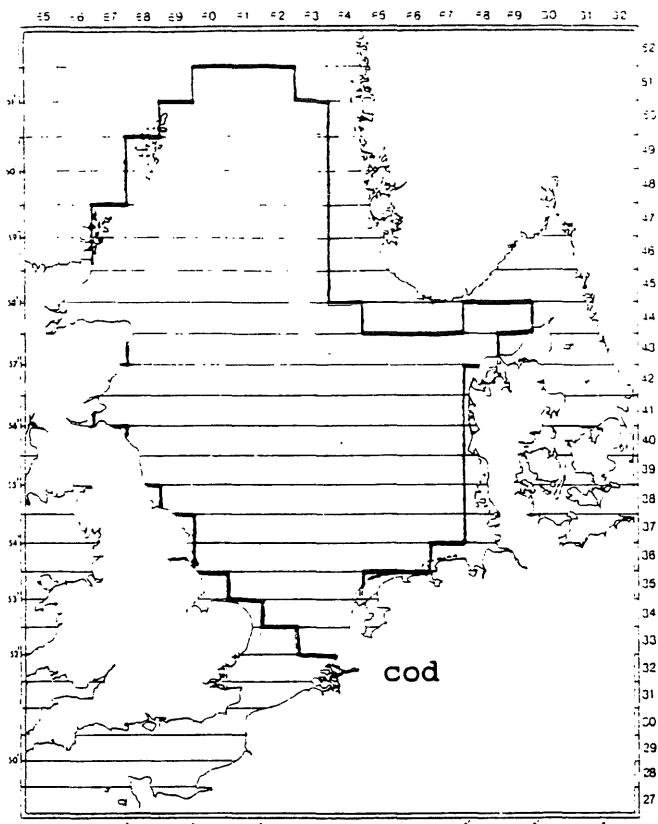

Figure 6.4 Standard areas for the calculation of the 'IYFS' abundance indices.

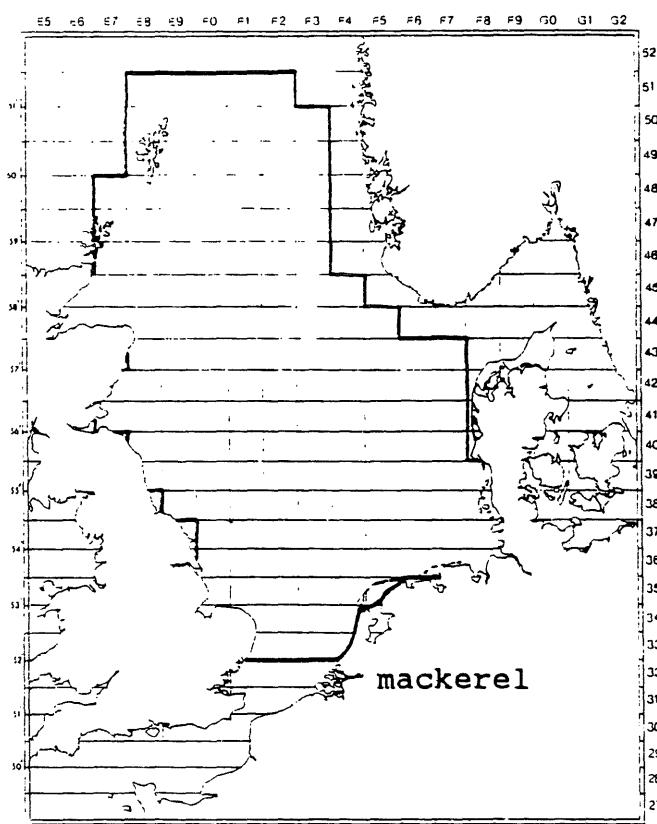

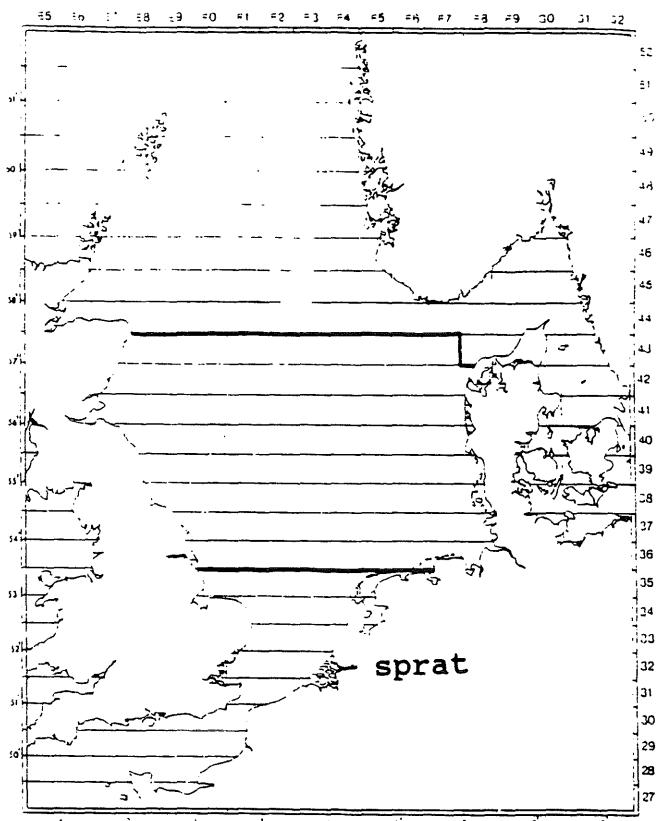

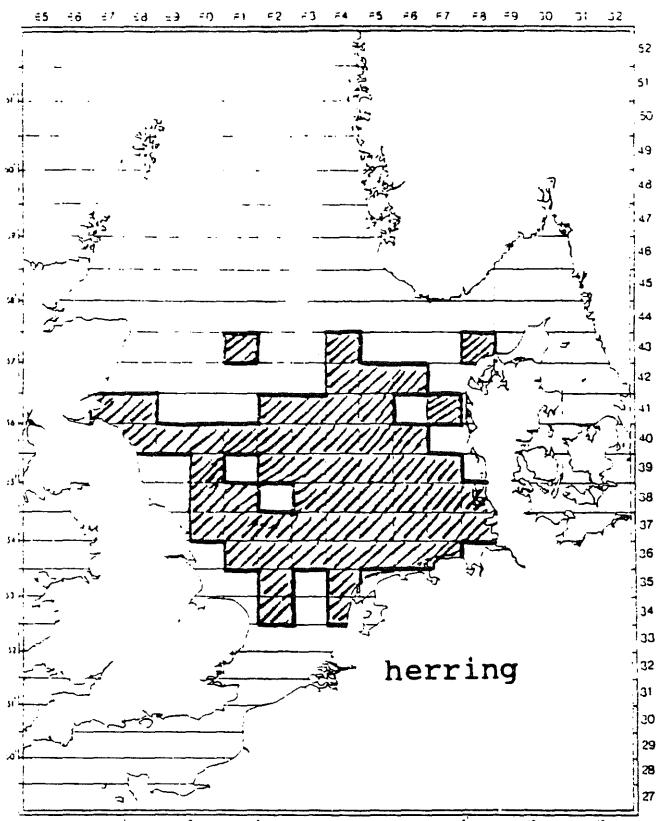

Figure 6.4 Continued

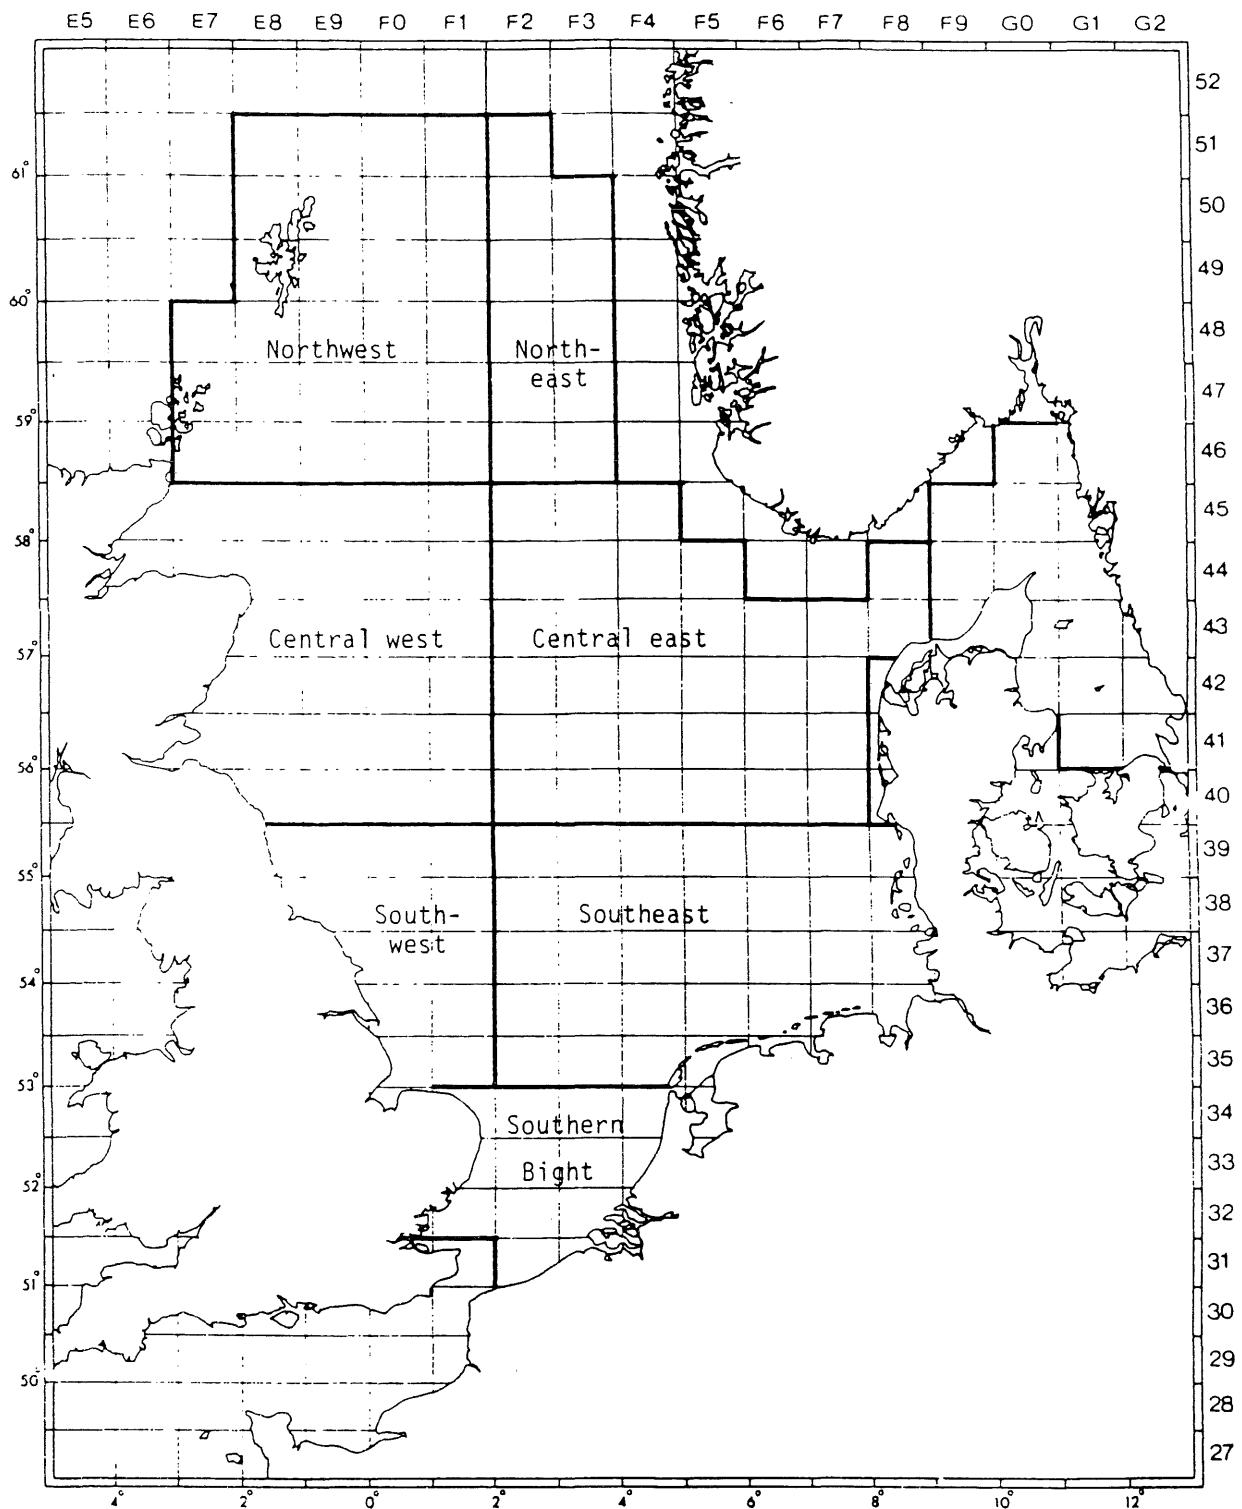

Figure 6.5 Subareas used for the calculation of abundance indices of herring larvae.

APPENDIX X

LENGTH SPLITS USED TO PROVIDE PRELIMINARY NUMBERS AT AGE

Age Quarter	0-group			1-group			
	2	3	4	1	2	3	4
cod	11	18	23	25	33	38	44
haddock	12	17	20	20	27	30	32
whiting	9	17	20	20	23	24	26
Norway pout	-	13	14	15	15	16	20
herring	-	15.5	17.5	20.0	21.0	23.0	24.5
sprat	-	-	10.0	10.0	10.5	13.0	14.0
mackerel	-	17	24	25	25	30	31
saithe	-	22	25	25	25	33	38
plaice	-	10	12	-	-	19	21

NB The lengths indicated are 'less than' lengths: 0-group cod in quarter 2 are fish <11 cm

APPENDIX XI

DRAFT PROPOSALS FOR 'WESTERN DIVISION'

NB This appendix only contains proposals for those parts of the Manual that will differ from the North Sea and Skagerrak/Kattegat IBTS Manual.

Rigging (western and southern areas)

The rigging is given in Figure 2.3.

The length of the sweeps should depend on the bottom depth:

- m sweeps (including backstrops) are used in water depths less than 70 m,
- m sweeps (including backstrops) are used in deeper waters.

However, on the very rough ground found to the west of Scotland and Ireland, in the Celtic Sea and in the Channel it is often necessary to use 60 m sweeps even in water deeper than 70 m depth.

[The above section on sweep lengths will be discussed further in talks led by the western division coordinator]

The standard groundrope with 10-20 cm rubber discs as shown in Figure 2.4 should be used throughout the survey area. The extra weights in the groundrope are 70 kg in the square, 35 kg in each wing and 35 kg in each wing-end. These weights should be evenly spread over the appropriate length of groundrope and this can be achieved by wrapping chain externally around the groundrope or, preferably, by interspersing the rubber discs with steel discs of the same diameter..

This standard gear should be used wherever possible but it is recognised that over much of the western division the grounds are very rough and some institutes prefer to use the groundgear illustrated in Figure App. 1.

It is very important to achieve good bottom contact over the whole groundrope and this should be checked regularly. A proper contact of the net can be indicated by acoustic devices, wearing on chains and presence of benthic organisms and flatfish in the catch. The contact of the net with the bottom can also be greatly influenced by changing the length of the adjustment chain between the lower leg and the bumper bobbin. The normal length of this chain is 2 metres but on rough ground it can be shortened to 1.7 metres; if the gear is fishing too light it can be lengthened to 2.2 metres. In addition the wings can be flown on extremely rough ground but all these modifications should be avoided if at all possible.

For a proper performance of the net it is essential that the four upper bridles are of identical length, and regular checks should be made to ensure this. It is also recommended that a total check of the trawl is carried out prior to the survey.

Standard fishing method (western and southern areas)

Standard fishing speed is 4 knots measured as trawl speed over the ground. The recommended speed is set as a target and actual (ground)speed and distance towed should be monitored and reported. It is also recommended that the speed of the trawl through the water should be monitored and reported.

Each haul lasts 30 minutes. Start time is defined as the moment when the vertical net-opening and doorspread are stable at a trawl speed of 4 knots. Stop time is defined as the start of pull back.

Vertical net opening and doorspread should be monitored at 30 second intervals and mean values should be reported. It is recommended that wing spread is also measured.

The recommended warp/depth ratio for the GOV trawl is shown in Figure 2.5. A minimum warp length of 150 m should be used as below this length the gear becomes unstable and insufficient spread is achieved. There is no maximum fishing depth in the western division.

Sampling of GOV-trawl catches and sampling areas (western and southern areas)

Length composition

Length distributions are recorded for all fish species caught. Length is defined as total length (measured from tip of snout to tip of caudal fin). Length is measured to 0.5 cm below for herring and sprat, and to 1 cm below for all other species.

In case the catch of a certain species is too large to measure all individuals, a sub-sample may be taken which should contain at least 50 specimens.

If a certain species is caught in two clearly distinct size groups, each of these size groups should be sampled separately by measuring at least 50 fish from each of them.

In case of large catches ($n > 1000$) of any species, the minimum sample size given above should be doubled.

Certain related species that are hard to distinguish from one another may be grouped by genus or larger taxonomic unit.

Sampling for age, sex and maturity

Otolith samples are collected within the specified sampling areas as illustrated in Figure App. 2. For all species the same areas are used but care should be taken not to extract otoliths from fish that exhibit length deformities.

The target species and otolith requirements are to be discussed.

For the smallest size groups, that presumably contain only one age group, the number of otoliths per length class may be reduced. Conversely more otoliths per length are required for the larger length classes.

Sex and maturity data may be reported for each species for which age data are collected. Maturity stages should be reported according to the simplified maturity scale given in Appendix II.
