

Shrimp in Greenland Waters

Management Strategies for Commercial Marine Species in
Northern Ecosystems

Bergen 27-29 august 2003

*By Helle Siegstad and Carsten Hvingel
August 2003*

Shrimp as they (sometimes) appears on the bottom

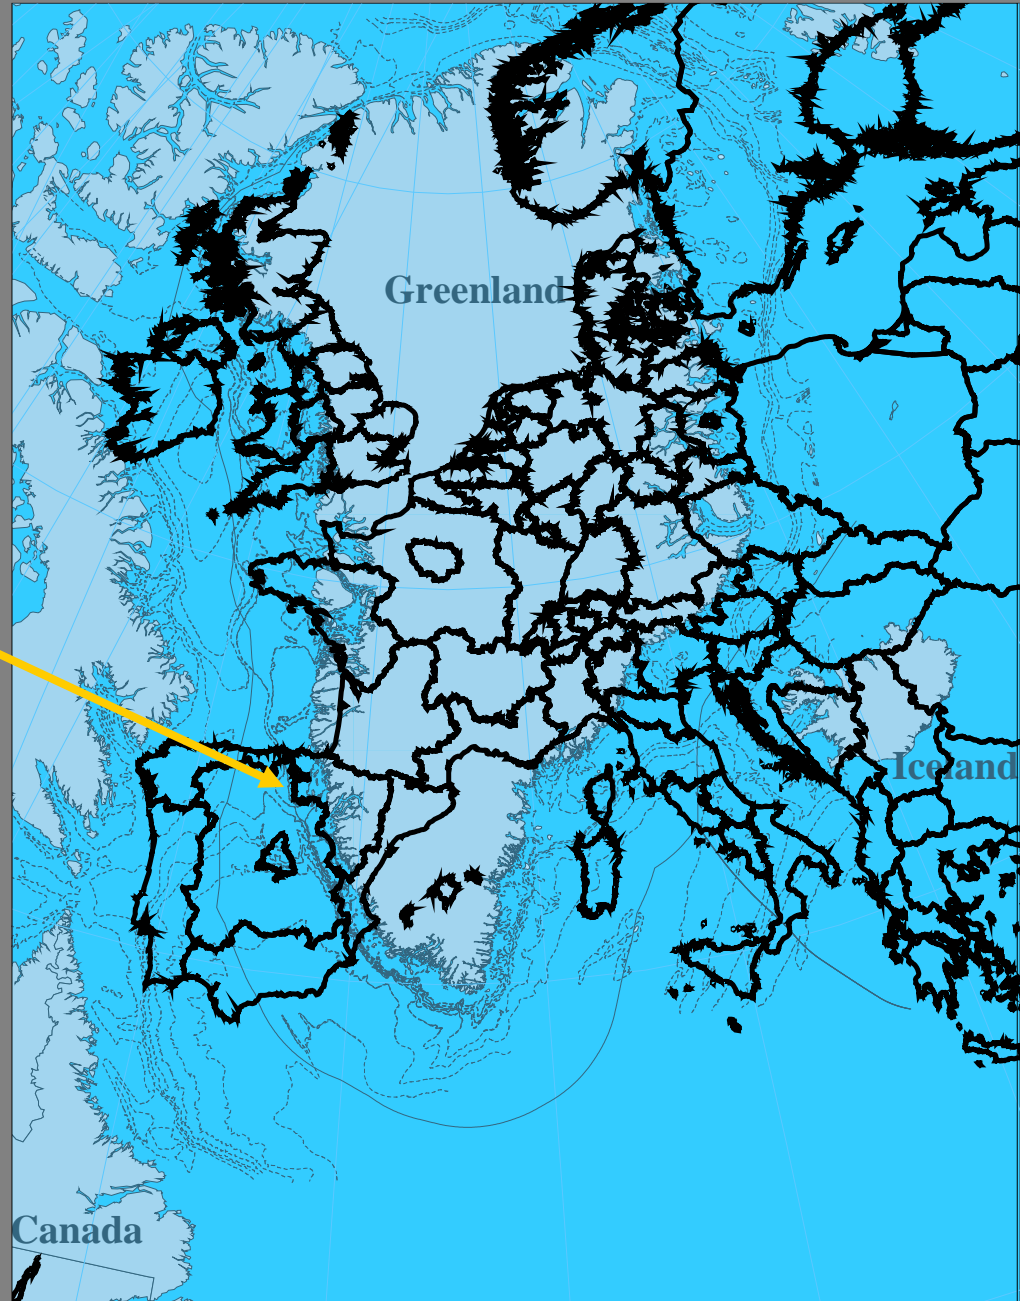

Greenland

Population: 56.000

West : 52.500

East: 3.500

- and Europe

Fishery in Greenland

Export in 2002 - 2.140 mill in total

Other exploited stock annual catch in numbers

• Thick-billed Murre	ca. 250.000	}	Marine
• Eider	ca. 100.000		
• Narwhal	ca. 700		
• White whale	ca. 700		
• Mink whale	ca. 150		
• Fin whale	ca. < 10		
• Harp seal	ca. 90.000		
• <u>Ringed seal</u>	ca. 100.000	}	Terrestrial
• Caribou + Moskos	ca. > 15.000		
• Ptarmigan	ca. 50.000		
• Sheep farming	??		

Our marine environment

warm current

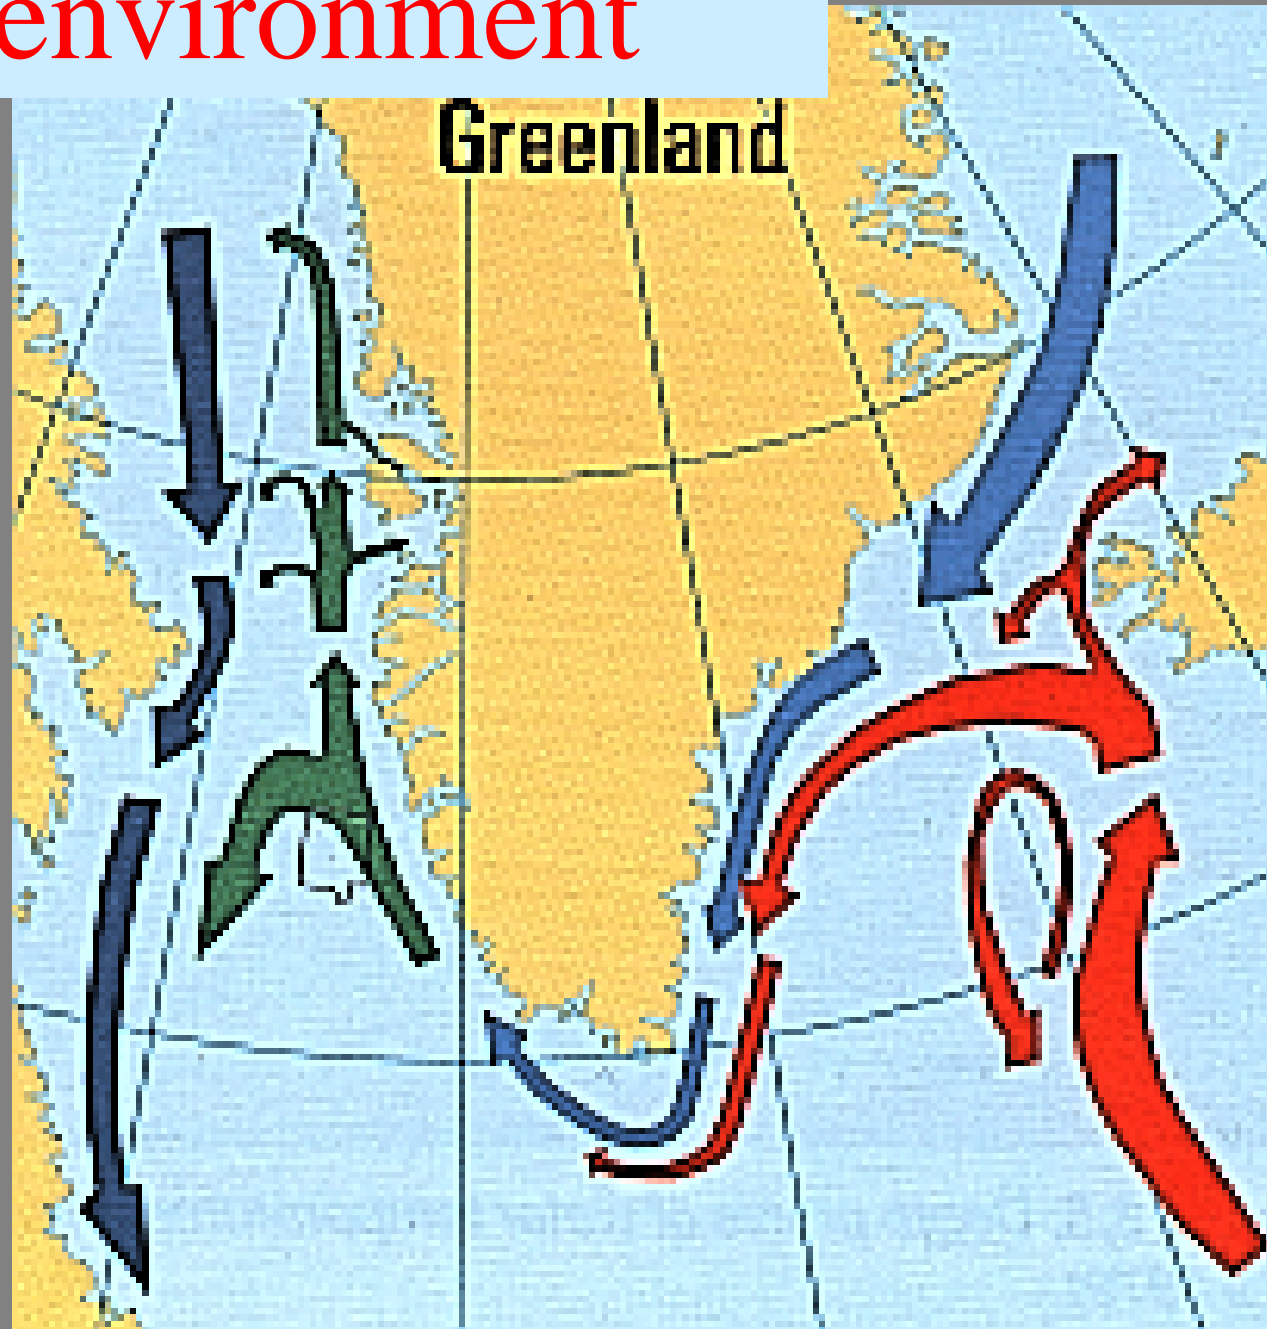

East Greenland Current -
cold current

West Greenland Current -
mix of cold and warm

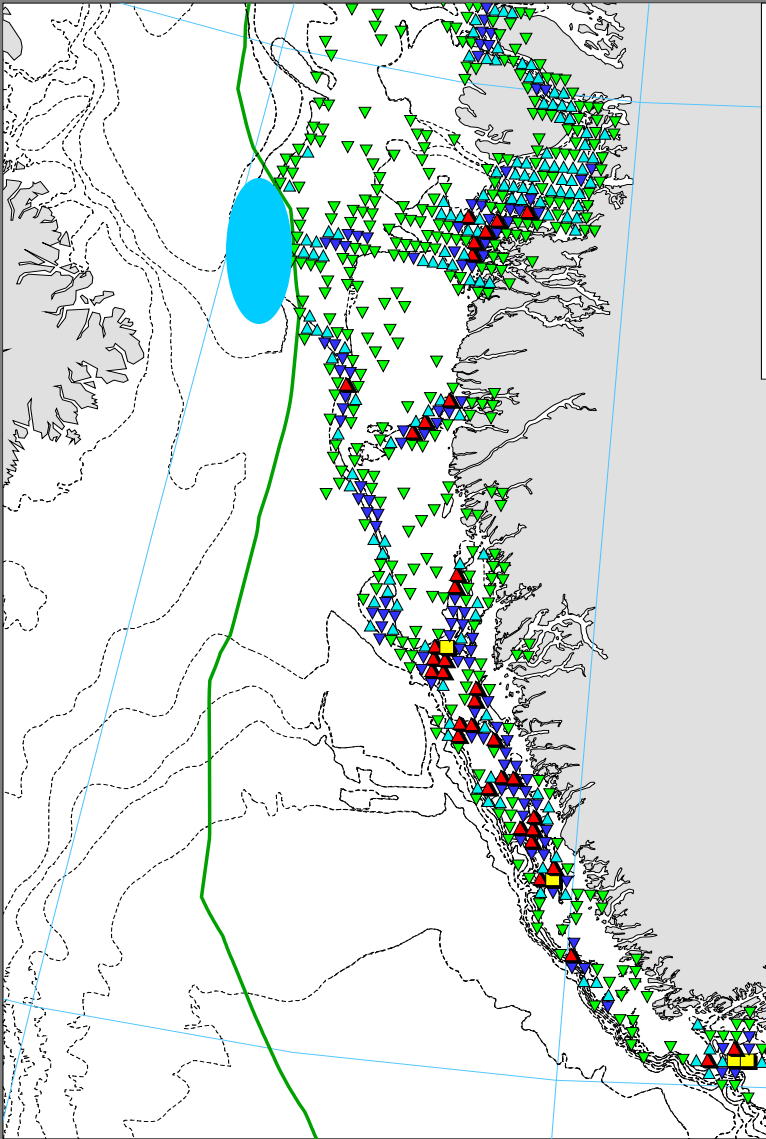

Baffin Land Current -
cold current

Shrimp catches East and West Greenland

The government politic for regulation

- The shrimp stock off West Greenland is assessed as a single population.
- The fisheries is regulated by:
 - Quotas (TAC)
 - Offshore fleet – in- or nearshore fleet - Canadian fleet
 - Technical measures
 - Mesh size / Grid
 - Observer program
 - By-catch

Assessment and advice of northern shrimp

- The biological advice for shrimp in the North Atlantic has traditionally been based on:
 - Qualitative assessment of trends in various indices
 - single-species assessment
 - one-year advice
 - no or few attempt on prediction models

Mathematical models

- Describe the development in the stock
- Include the influence of cod
- Predictions
- Risk calculation

Carsten Hvingel Ph.d. project:

Alternative assessment framework based on biological model of shrimp dynamic

- Bayesian methods

Data

- Biomass indices
 - Catch
 - Cod predation
 - Uncertainty
-
- Not included in the model at time being:
 - size/age distribution – recruitment - SSB

Biomass

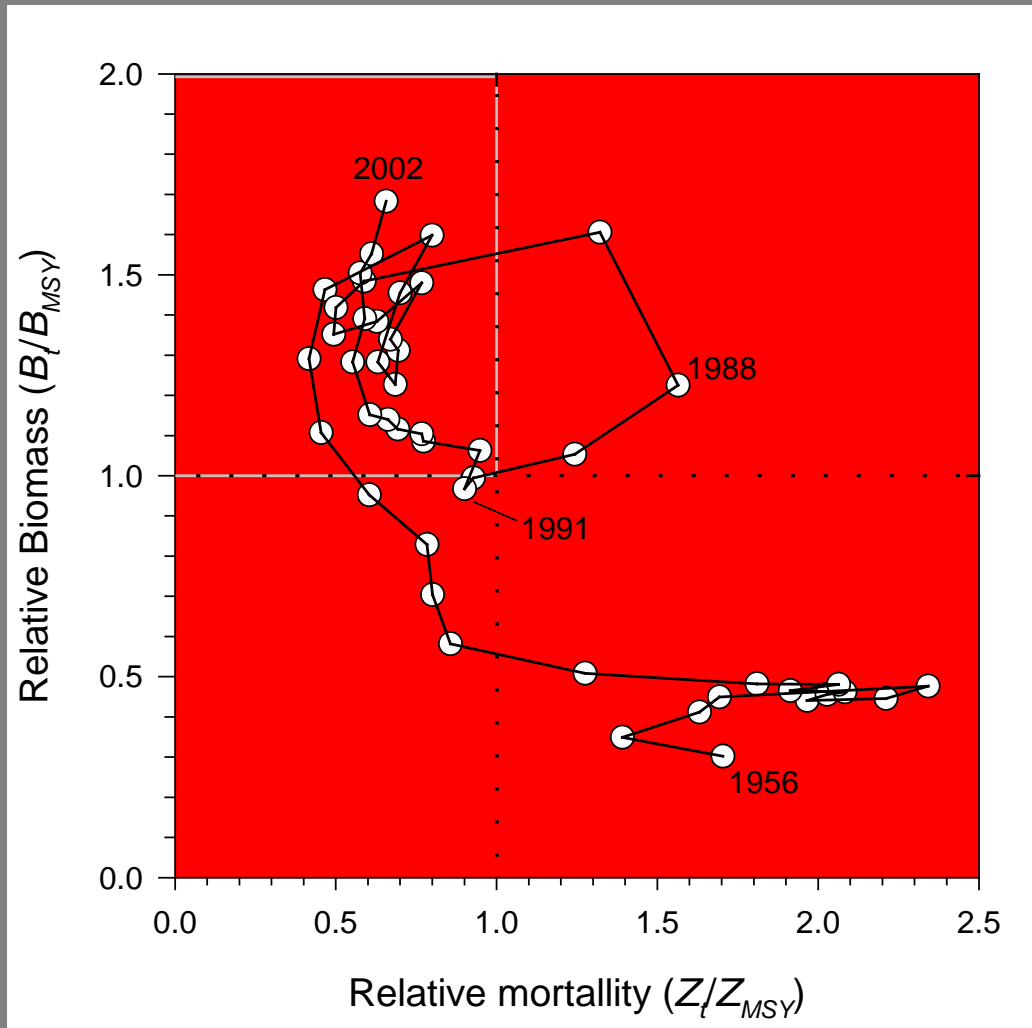

Catch

Biomass of cod

Development in shrimp stock

Risk associated with five optional catch levels

Catch option ('000 tons) in 2003	80	90	100	110	120
Risk of falling below B_{MSY}	<1%	<1%	<1%	<1%	1%
Risk of exceeding Z_{MSY}	1%	3%	10%	20%	34%

Status

Shrimp West-Greenland

- The stock biomass has increased since the early-1990s and reached its highest level recorded in 2002.
- Biomass is well above B_{MSY} and mortality by fishery and cod predation is well below Z_{MSY} .
- In addition a large 1999-year class is expected to contribute to the fishery in 2003.

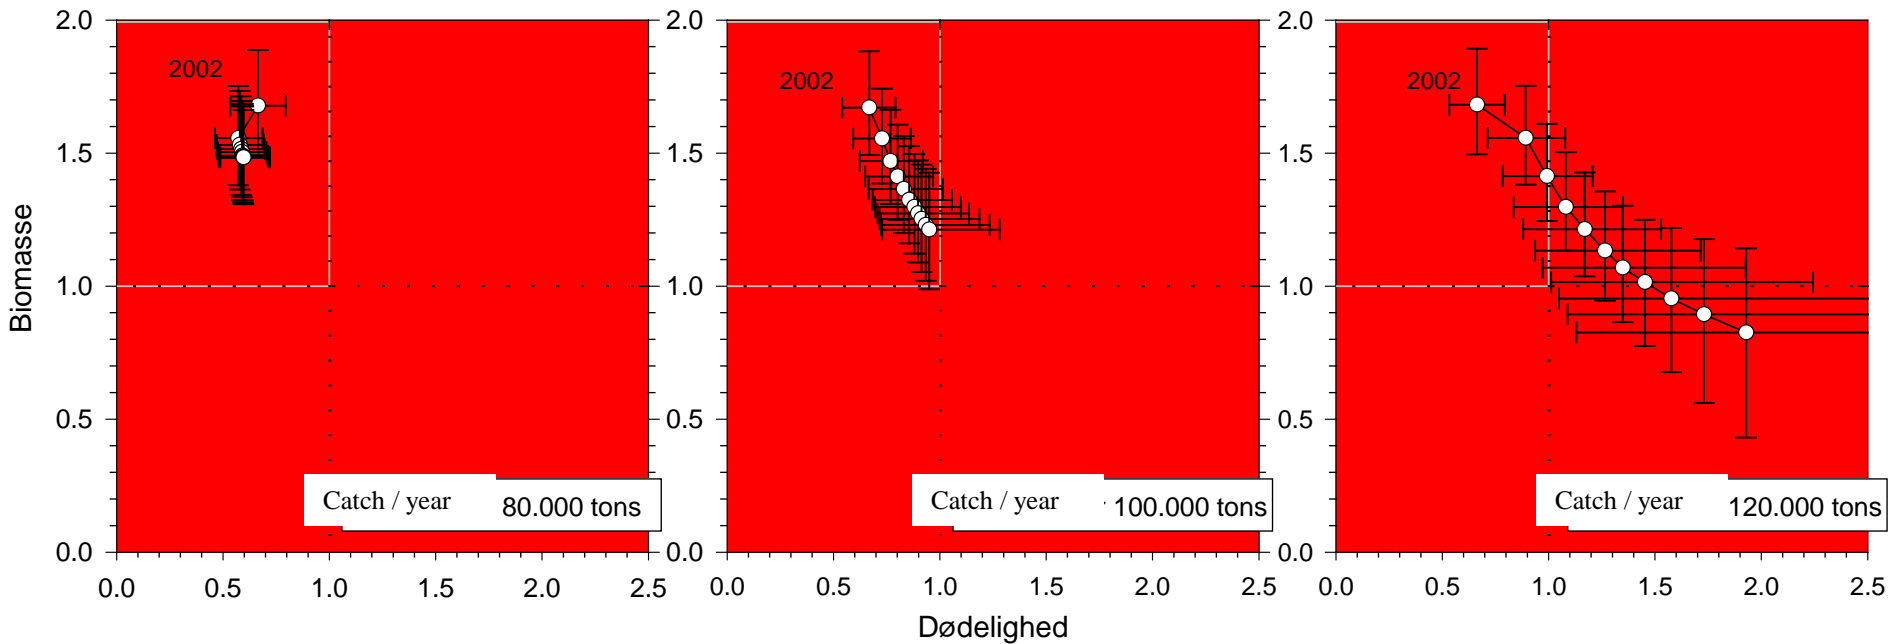

Advice for 2003 Westgreenland

- If catches exceed 100 000 tons in 2003 there is a greater than 10% risk of exceeding a mortality, that is considered to be a limit reference point.
- NAFO Scientific Council recommends that total catch in Div. 0A and SA 1 in 2003 should not exceed 100 000 tons.

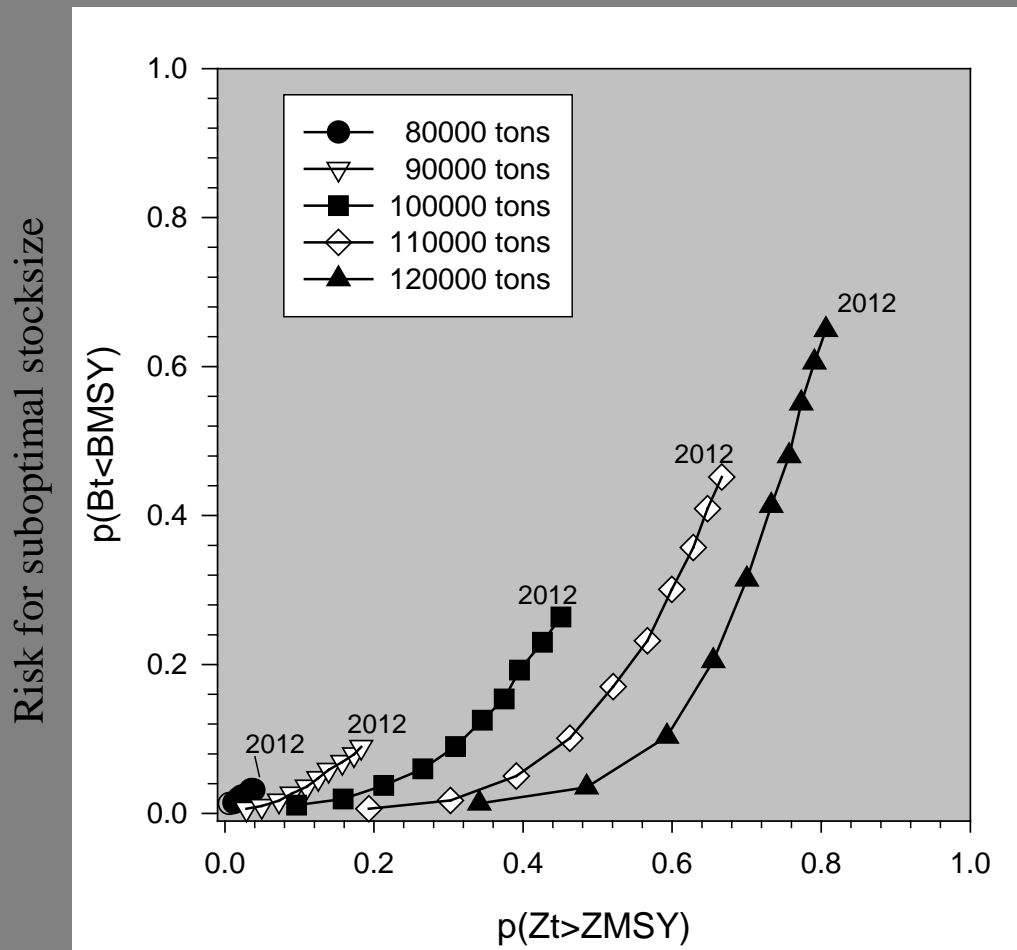

After 2003??

Future expected development

(...with a cod stock on present level!)

Risk evaluation

Risk for unsustainable fishery

Estimated consumption of shrimp by cod

Estimated consumption of shrimp by cod

Catch of shrimp in Alaska 1965-85

We do see changes!!

- What is influencing these changes?

- interaktioner:

- cod / shrimp / snow crab / seals / whales / sea birds
- whom eat whom – takeout in general
 - incl. fishery and hunting
- How must – and what does it mean

- temperature – ice

- bycatches

- trawling og effect on bottom habitat

Ecogreen (Goal: to establish a scientific basis for a long term ecosystem based management of renewable resources)
