SERIE B  
1975 Nr. 5

September 1975

## INNLEDNING

Da dr. Jens Eggvin i 1969 fratrådte som leder for den oseanografiske avdeling ved Fiskeridirektoratets Havforskningsinstitutt, hadde han fullført nesten 40 års tjeneste. Allerede i midten av 30-årene startet han flere observasjonsserier som fremdeles pågår. En av disse seriene gjelder observasjon over temperatur og saltholdighet i overflatelaget langs norskekysten mellom Oslo og Kirkenes. Disse observasjonene foretaes av kystrutefartøyer. Eggvin brukte dette materialet sammen med andre observasjonsdata for å holde kontinuerlig oppsikt med de hydrografiske tilstander i kystfarvannene (Eggvin 1940). Tar en med observasjoner til og med 1970 er det blitt en komplett 35-års serie som nå er brukt til beregning av gjennomsnittsverdier og avvik for 25 lokaliteter langs kysten. Det er en glede å presentere disse verdifulle informasjonene, men æren skal gies til dr. Jens Eggvin og til de mange observatørene ombord i rutefartøyene.

## PREFACE

When dr. Jens Eggvin in 1969 retired from his profession as head of Division of Oceanography at the Institute of Marine Research, Bergen, he had completed almost 40 years of service. Already in the midthirties Eggvin started several observation series which are still running. One of these series includes sea surface temperature and salinity observations along the whole Norwegian coast between Oslo and Kirkenes. The observations are carried out by coastal liners. The material was together with materiale from other sources used by Eggvin for the purpose of watching the current situation in the hydrographic condition of the coastal water of Norway (Eggvin 1940). When including the observations as far as 1970, there is a 35 years serie completed which now has been used for computation of means and deviations for 25 localities along the coast. It is a pleasure to present these valuable informations, but the honour should be given to dr. Jens Eggvin and to the many observers onboard the coastal liners involved.

## 1. OBSERVASJONENE

Rutefartøyer mellom Oslo og Bergen og mellom Bergen og Kirkenes er utstyrt med sjøtermografer. På bestemte lokaliteter i skipsruten settes merker på termogrammet samtidig som man leser av et kontrolltermometer og tar vannprøver. Termogrammer, posisjonskart og prøver blir etter hver tur bragt til instituttet for videre behandling.

Fig. 1 viser de 25 observasjonslokalitetene. Hver stasjon blir observert ca. 2 ganger i uken.

## 2. TEMPERATUR

### 2.1 10 dagers middel

De observerte verdiene fra hver lokalitet er plottet på et temperatur-tidsdiagram og forbundet med rette linjer. 10 dagers middel er så avlest i diagrammet og listet i tabellene bak.

### 2.2 35-års normal

Gjennomsnittsverdien av alle 10 dagers midlene innen en 10 dagers periode fra 35 år er utregnet og oppført som 10 dagers normal for hver lokalitet. For å få en idé om variasjonene er også standard avvik beregnet. Både normalene og standardavvikene er listet i tabellene.

### 2.3 Overflatetemperatur 1936-1970

7 av de 25 lokalitetene (navnene er understreket i Fig.1) er også illustrert med figurer. Fig. 2 viser alle de observerte verdiene fra 1936-1970. Fig. 3 gir normalen og standardavvik. Langtidsforandringer er illustrert med kurver som viser glidende årlige midler (Fig. 4). Temperaturforholdene gjennom den kaldeste årstiden februar, mars og april kan være av spesiell interesse og gjennomsnittstemperaturen for disse tre månedene er vist i Fig. 5.

## 3. SALTHOLDIGHET

### 3.1 Månedsmidler

Saltholdighetsverdiene er behandlet på nesten samme måte som tempera-

## 1. THE OBSERVATIONS

Coastal liners between Oslo and Bergen and between Bergen and Kirkenes are equipped with Sea thermographs. At certain localities on the ships routes marks are entered on the recording sheets at the same time as thermometer control readings are made and water samples taken. Log sheets, recordings and samples are collected onboard after each trip and brought to the institute for further treatment.

Fig. 1 shows the positions of 25 localities where observations are undertaken. Every stations is observed about twice a week.

## 2. TEMPERATURE

### 2.1 10 days means

The observed values from each locality are plotted in a temperature versus time diagramme and connected by straight lines. 10 days means are taken from the diagrammes and listed in the tables behind.

### 2.2 35 Years Normals

The mean value of all 10 days means within each 10 days periode from the 35 years have been calculated and are introduced as 10 days Normals for each locality. In order to get some idea of the variability the standard deviations have also been computed. Both the normals and the standard deviations are listed in the tables behind.

### 2.3 Surface temperature 1936-1970

The conditions at 7 of the 25 localities (names underlined in Fig.1) have also been illustrated with figures. Fig. 2 shows all observed values through 1936-1970. Fig. 3 gives the normals and the standard deviations. Long term fluctuations are illustrated by curves showing the consecutive annual means (Fig. 4). Temperature conditions during the coldest season February, March and April might be of particular interest and the mean temperature for

turene, med det var ikke funnet nødvendig å inndele i 10 dagers perioder; det er brukt perioder på en måned og månedsmidlene er beregnet aritmetisk og listet i tabellene.

### 3.2 35-års normal

Gjennomsnittsverdien av alle månedsmidlene i hver måned over 35 år er utregnet og tatt som månedsnormaler på hver lokalitet. Standardavvik er også beregnet. Både normaler og standardavvik er listet i tabellene.

### 3.3 Overflatesaltholdighet 1936-1970

Fig. 6 viser saltholdighetsverdier observert på 7 av de 25 lokalitetene. Fig. 7 viser normalene og standardavvikene. De glidende årlige midler er vist i Fig. 8.

### LITTERATUR

Eggvin, J. 1940. The movements of a cold water front. Rep.Norw. Fishery mar.Invest 7, (5), 151 pp.

those three months are shown in Fig. 5.

### 3. SALINITY

#### 3.1 Monthly means

The salinity values are treated nearly in the same way as the temperatures, only it was not found necessary to divide into 10 days periods; periods of one month have been used and the monthly means are found arithmetically. They are listed in tables behind.

#### 3.2 35 Years Normals

The mean value of all monthly means within each month from the 35 years have been calculated and introduced as Monthly Normals for each locality. The standard deviations have also been calculated. Both Normals and standard deviations are listed in the tables behind.

#### 3.3 Surface salinity 1936-1970.

Fig. 6 gives the salinity values observed of 7 of the 25 localities. In Fig. 7 are the normals and the standard deviations. The consecutive annual means are shown in Fig. 8.
